# 1 The Fine Cyclo reducer

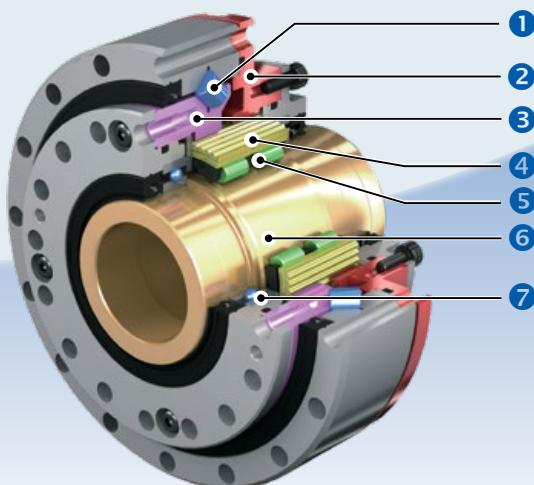

Construction A Series

- ① Cycloid disc
- ② Eccentric input shaft
- ③ Input shaft bearing
- ④ Main Bearings
- ⑤ Ring gear (housing)
- ⑥ Oil seal output side
- ⑦ Output flange
- ⑧ Output shaft

**Construction DA Series****Construction C Series****Construction UA Series**

- 1 Cycloid disc
- 2 Eccentric input shaft
- 3 Input shaft bearing
- 4 Main Bearings
- 5 Ring gear (housing)
- 6 Oil seal output side
- 7 Output flange
- 8 Output shaft
- 9 Planetary gears
- 10 Input shaft with spur gear

**Construction E Series**

- 1 Main bearing (cross roller bearing)
- 2 Ring gear housing
- 3 Output ring gear housing
- 4 Cycloid spline
- 5 Eccentric bearing
- 6 Eccentric input shaft
- 7 Input shaft bearing

## 1.1 Operating principle - Series A, DA, and C

The gearbox of the Fine Cyclo series is fundamentally different in principle and mechanism from the helical gearing mechanism of competitors' gear motors. The unique reduction gearbox is an ingenious combination of the following two mechanisms:

- A planetary gear and a fixed internal sun gear (hollow gear). On the Fine Cyclo the planetary gear has cycloidal cam motion (cycloid disc) and the fixed sun gear has a circular arrangement of ring gear pins. The fixed sun gear has one or two "teeth" more than the "planetary gear" (cycloid disc).
- A spline for constant speed.

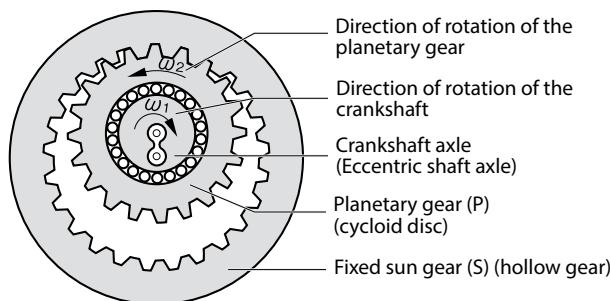

Fig. 1 Principle of the internal planetary gearbox

In Equation 1, below, P identifies the number of the planetary gear teeth, S that of the sun gear, and  $\omega_2$  the angular velocity of the planetary gear about its own axis (see Fig. 1). The speed ratio of  $\omega_2$  to  $\omega_1$  is represented as follows:

$$\text{Equation 1} \quad \frac{\omega_2}{\omega_1} = 1 - \frac{S}{P} = -\frac{S - P}{P}$$

The highest velocity ratio is obtained with S greater than P by one or two in this equation.

In other words, if  $S-P=1$  is applied to equation 1, the velocity ratio may be calculated using the following equation:

$$\text{Equation 2} \quad \frac{\omega_2}{\omega_1} = -\frac{1}{P}$$

If, on the other hand,  $S-P=2$  is applied to equation 1, the velocity ratio may be calculated using the following equation:

$$\text{Equation 3} \quad \frac{\omega_2}{\omega_1} = -\frac{2}{P}$$

As the crankshaft rotates at the angular velocity  $\omega_1$  around the axis of the sun gear, the planetary gear also rotates at the angular velocity:

$$-\frac{1\omega_1}{P} \text{ or } -\frac{2\omega_1}{P}$$

P indicates the number of teeth of the planetary gear and the symbol indicates that the planetary gear rotates in a reverse direction to that of the crankshaft (eccentric).

As shown in Fig. 2, the teeth (pins) arranged in a circular formation for the sun gear and the epitrochoid teeth for the planetary gear on the Fine Cyclo are adapted so that the gearings do not interfere with one another.

The rotation of the planetary gear around its own axis is caused by a constant speed internal gearing mechanism as shown (see Fig. 4).

In this mechanism, shown in Fig. 4 the pins of the output shaft are evenly spaced on a circle that is concentric to the axis of the sun gear. The pins transmit the rotation of the planetary gear by rolling internally around the circumference of the bores of each planetary gear or cycloid disc.

The diameter of the bores minus the diameter of the slow speed shaft pins is equal to twice the eccentricity value of the crankshaft (eccentric).

This mechanism smoothly transmits only the rotation of the planetary gear around its own axis to the output shaft.

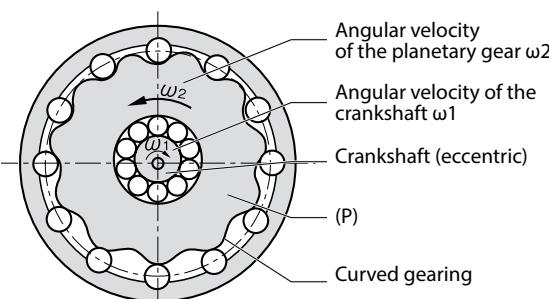

Fig. 2 Epitrochoidal planetary gear, circular arrangement of ring gear pins (PIN) combination

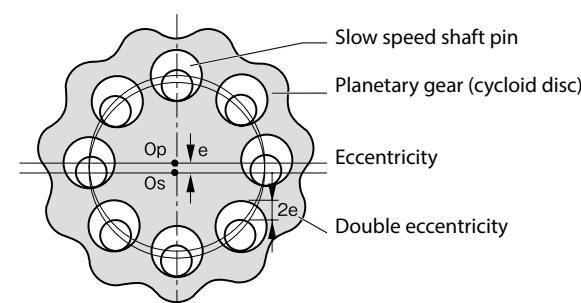

Fig. 3 Internal gearing for constant speed

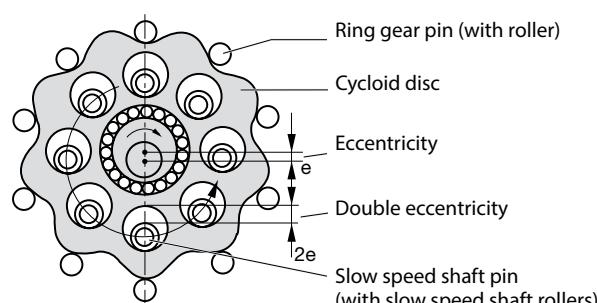

Fig. 4 Planetary sun gear combination and internal gearing for constant speed

## 1.2 UA series operating principle

The UA series gearboxes are double-stage and differ from the single-stage series in that they have 3 eccentric discs (cycloid disc) which are driven by the input shaft with spur teeth. The cycloid discs are driven via 3 eccentric shafts and not directly by one eccentric input shaft. The pins and the eccentric shafts in the output shaft are evenly spaced on a circle, which is concentric with the axis of the sun gear. The pins transmit the rotation of the planetary gear by rolling internally around the circumference of the bores of each planetary gear or cycloid disc.

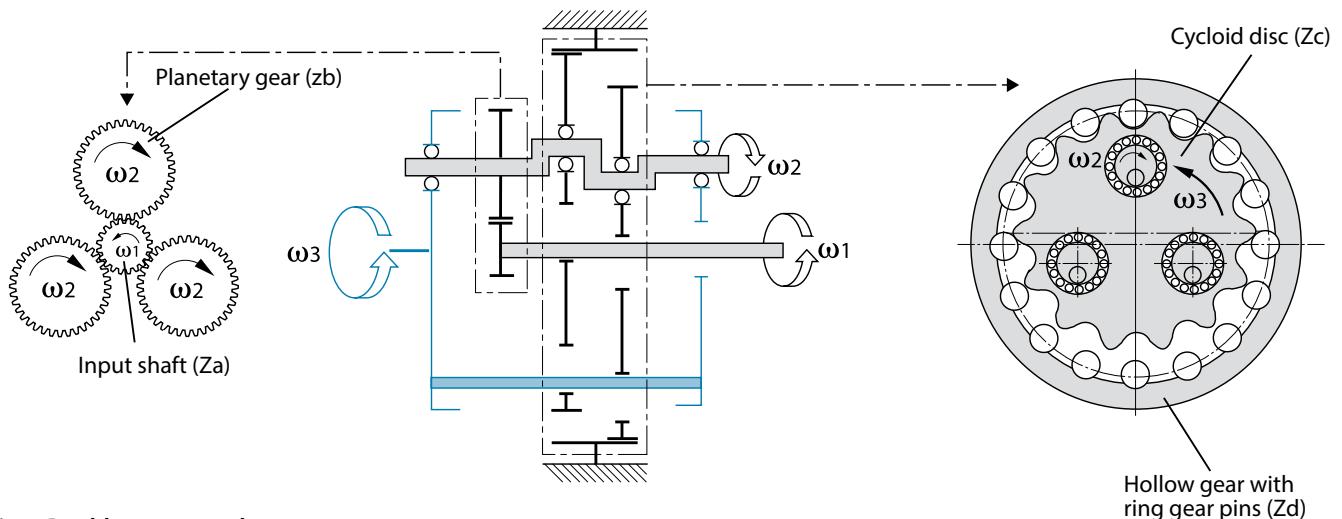

Fig. 5 Double-stage gearbox

If the input shaft rotates with a speed  $\omega_1$ , then the angular velocity of the planetary gear around its own axis is  $\omega_2$ .

If the eccentric shaft rotates with a rotational speed  $\omega_2$  and the hollow gear is fixed, then the angular velocity of the cycloid discs about their own axis is  $\omega_3$ . Z is the number of teeth or the number of curve traces or ring gear pins.

$$\text{Equation 1 } \omega_2 = \frac{Z_a}{Z_b} (\omega_3 - \omega_1) + \omega_3$$

$$\text{Equation 2 } \omega_3 = \left(1 - \frac{Z_d}{Z_c}\right) \cdot \omega_2$$

Partial reduction ratio when the angular velocity of the eccentric shaft gear around the input shaft is equal to 0:

$$\text{Equation 3 } i_1 = \frac{Z_b}{Z_a}$$

Partial reduction ratio of the trochoid gearing:

$$\text{Equation 4 } i_2 = \frac{Z_c}{(Z_c - Z_d)}$$

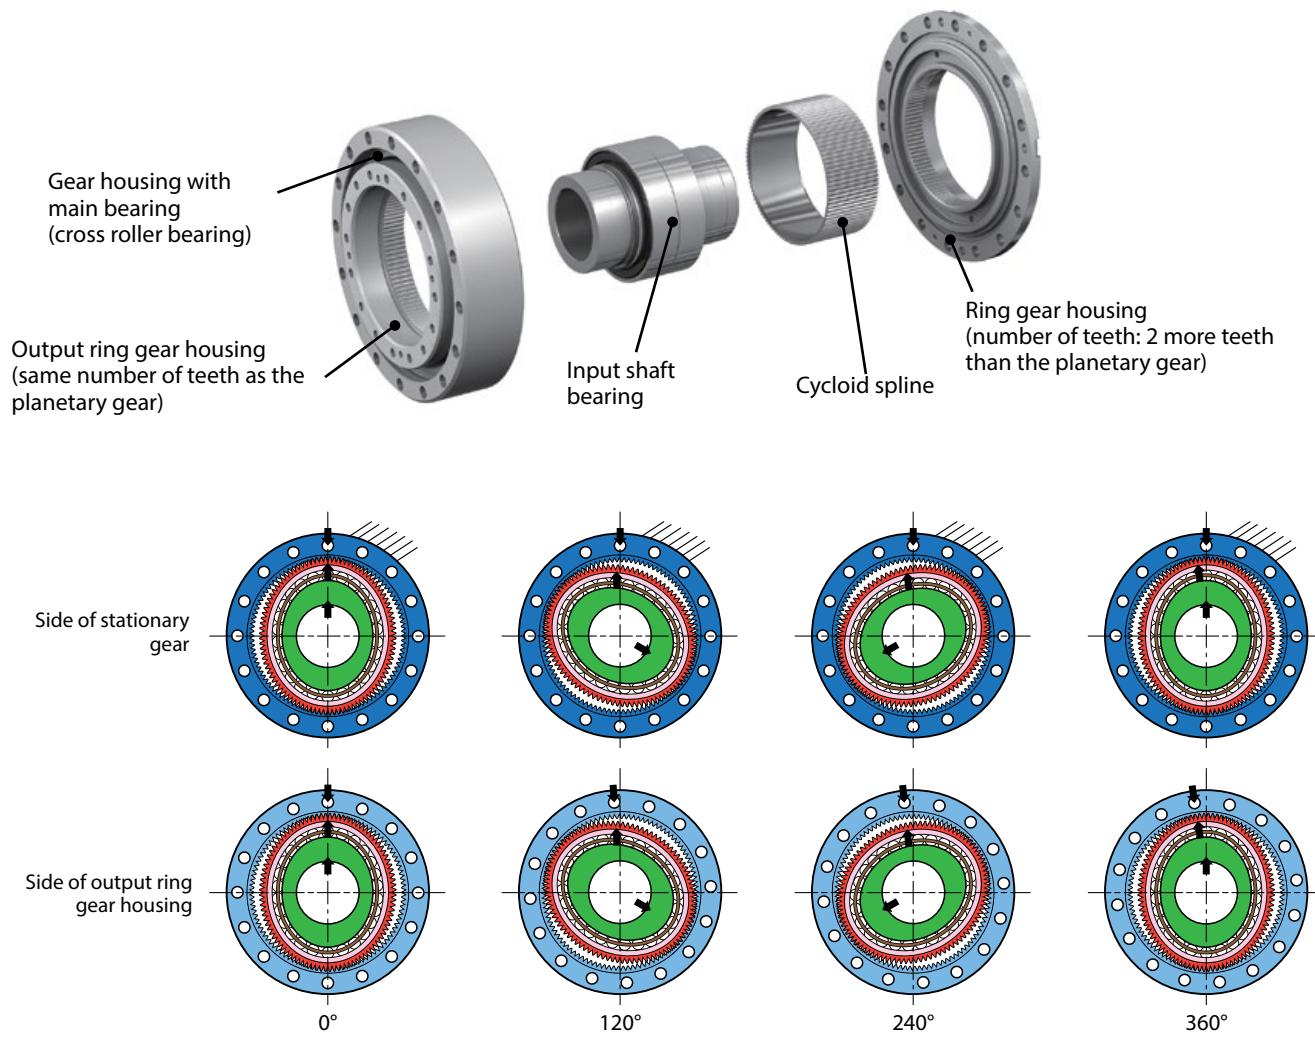

$$\text{Equation 5 } i = 1 + i_1 \cdot (1 - i_2)$$

$$\text{Total reduction ratio } i = \omega_1 / \omega_3$$

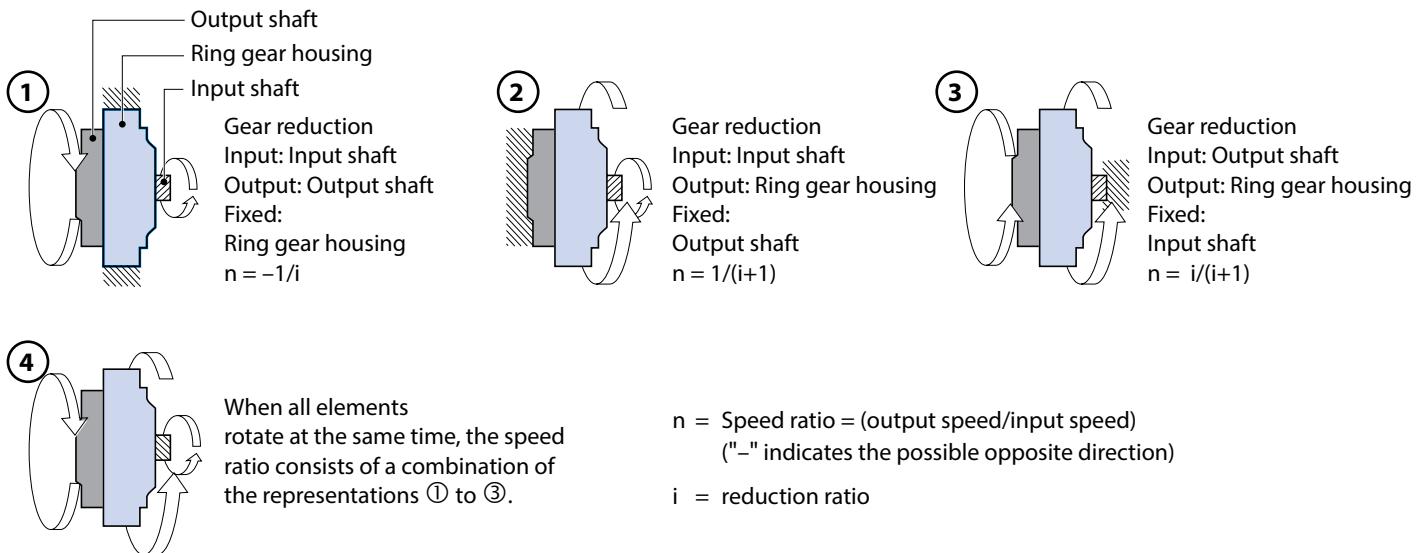

### 1.3 Operating principle of Series ECY

Every ECY series model always comprises four components.

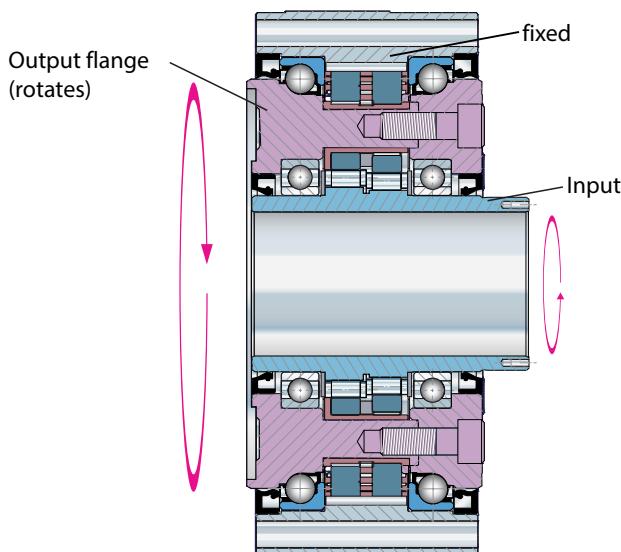

- The eccentric bearing deforms the planetary gear into an elliptical shape.
- The main axis of the cycloid spline, which now has an elliptical shape, engages with the ring gear housing and the output ring gear housing.
- If the housing containing the internal gear is actually stationary and the eccentric bearing rotates clockwise, the cycloid spline rotates anti-clockwise by exactly the difference in the number of teeth and is elastically deformed in the process.
- This rotation is transferred via the output ring gear housing.

## 1.4 Speed ratio and rotation direction - A, DA, C and E series

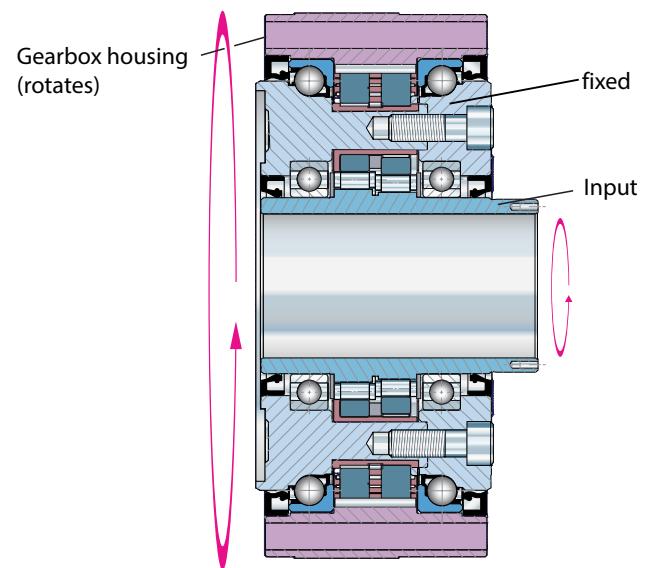

### Output flange rotates

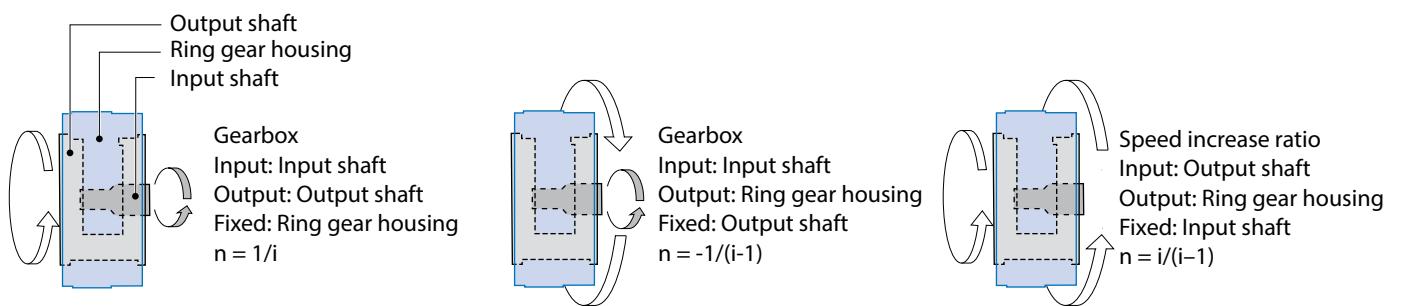

Catalogue reduction

### Gearbox housing rotates

Catalogue gear reduction +1

## 1.5 UA series speed ratio and rotation direction

## 1.6 Features and advantages

### Table A1 Compact design

The high reduction ratios, in one or a maximum of two stages, allow for extremely compact designs with a long lifetime. Moreover, due to the different versions available, these gearboxes can be optimally integrated into the machine environment.

### Simple installation

The Series A, DA and C gearboxes are lubricated for life in the factory and completely sealed, as well as being maintenance-free. Convenient and simple motor mounting is also taken account of in all ranges.

### Table A2 Precise positioning

In more and more applications, high cycle speed and precise positioning are required in order to increase the efficiency of machines or to develop new applications. The special Cycloid systems of the Fine Cyclos offer high-precision positioning with maximum dynamics.

### Table A3 Precision gearbox with large hollow shaft bore and high capacity bearing

The C Series gearbox was specifically developed with an extra large hollow shaft bore through which supply lines, shafts, and other media can be passed. The integrated bearing can handle high loads on the output side that may arise when using machine tools, in positioning or during robotics applications.

### The right size for every application

## 1.7 Application Examples

Axe drive for industrial robot

Pallet changer drive

Welding positioner

Machine tool  
Automatic pallet pool input

Palletising robot

Liquid crystal transfer robot

The wide range of gearbox series and the many size gradations within each series enable selection of the right gearbox for any precision application.

Gearboxes with external diameters ranging from 74 mm to 570 mm are available. With these, a range of acceleration torques from below 100 Nm up to 30,000 Nm can be covered.

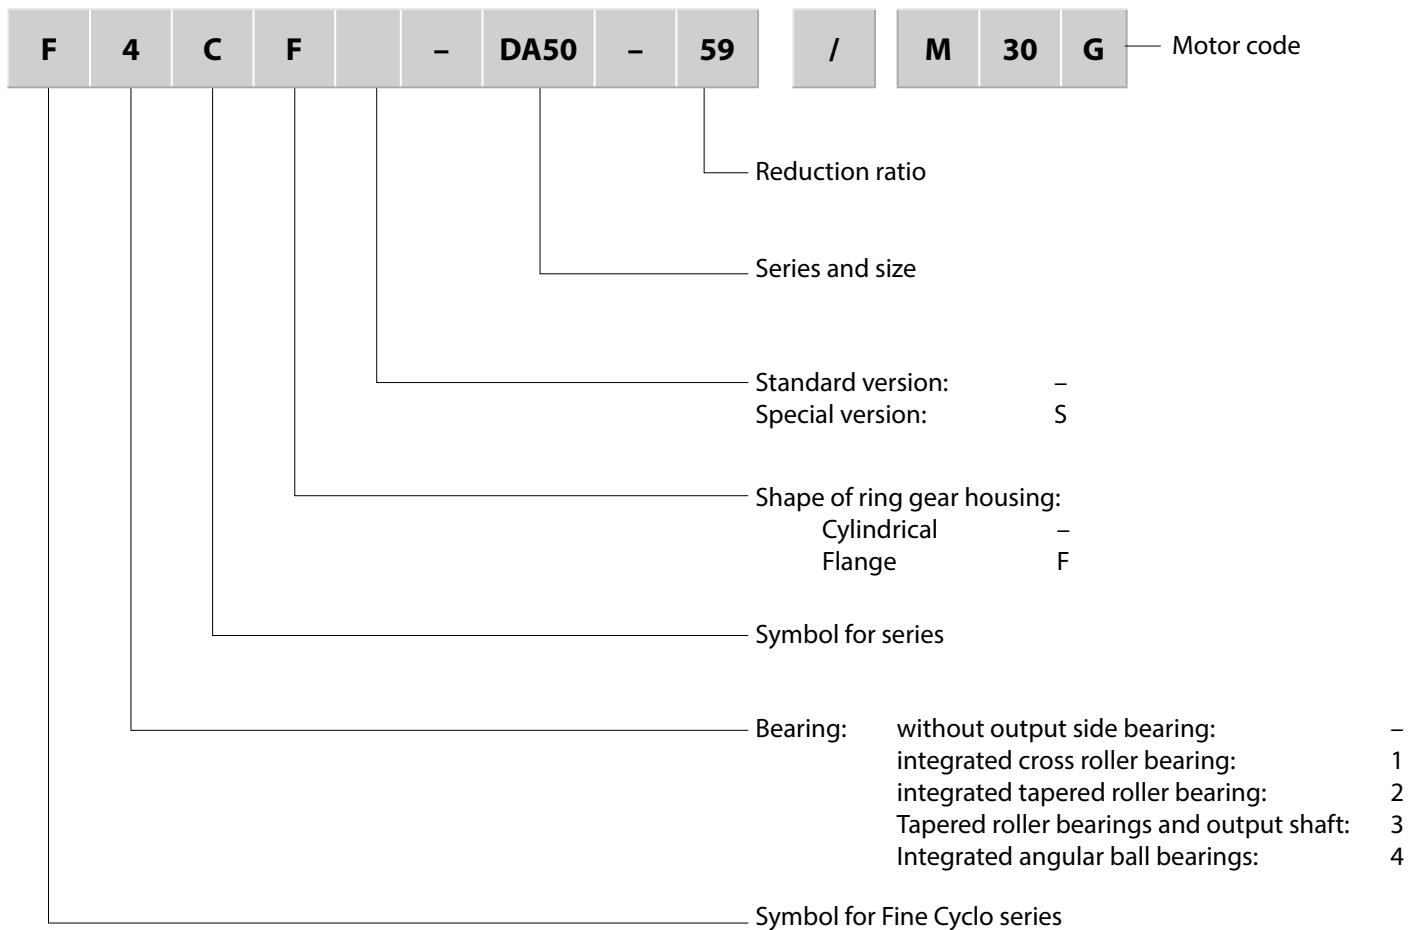

In the event that the emergency stop function is activated, this precision gearbox can even be safely subjected to a load of 60,000 Nm.

### Table A4 High torsional stiffness and low mass moments of inertia

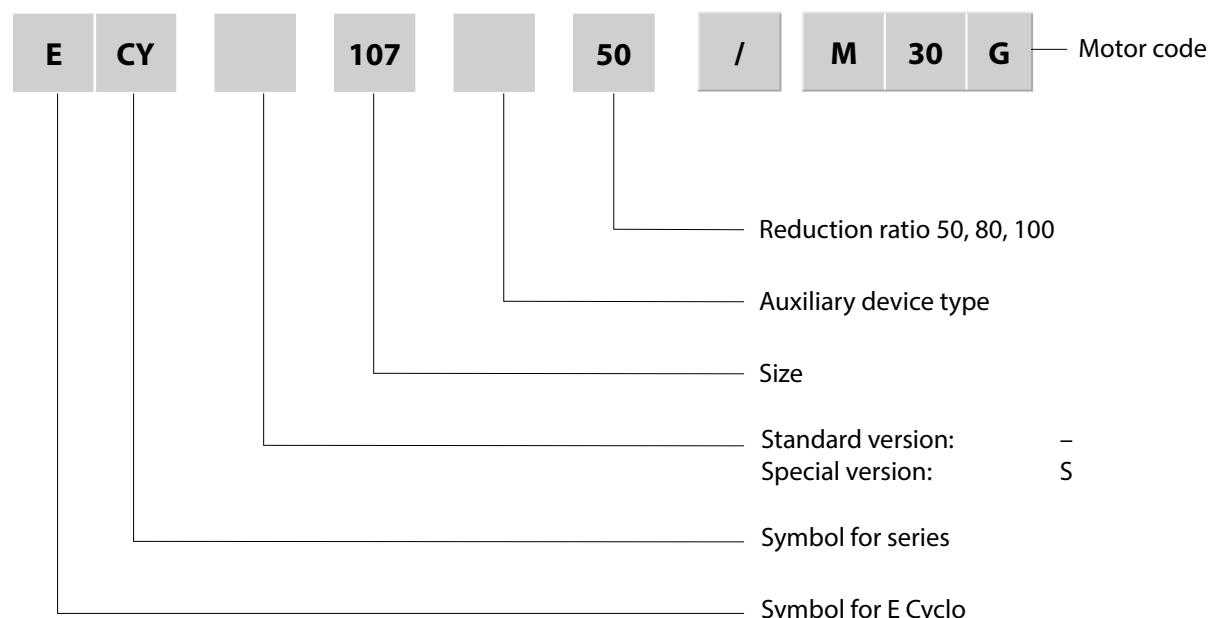

For these application areas, Sumitomo Drive Technologies has developed highly accurate series of backlash-free precision gearboxes. Compared with conventional gearboxes, the construction principle offers the highest torsional stiffness as well as low mass moments of inertia - ideal for highly dynamic tasks.

## 2 Nomenclature

### 2.1 Fine Cyclo

### 2.2 E Cyclo

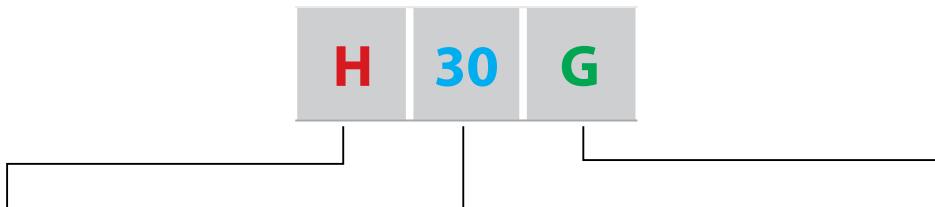

The Motor Interface Code - nomenclature applies to the following standard gearbox series with standardised motor mounting:  
DA series, UA series and ECY series.

## 2.3 Structure of the Motor Interface Code

The motor code is comprised of four characters.

**Table A5 Example:**

The first letter describes the motor shaft diameter.

It is described with a single letter.

Example:

H corresponds to the motor shaft diameter Ø14 mm

The second and third digits describe the dimensions of the motor flange. These are described with numbers.

Example:  
30 corresponds to centering: Ø80  
Pitch circle diameter: Ø100  
Bolting: M6

The last character describes the version. This is also described with a single letter.

Example:

L corresponds to the version of the motor shaft

Motor shaft code	Hole for shaft
Y	Special
A	Ø 7
B	Ø 8
C	Ø 9
D	Ø 10
E	Ø 11
H	Ø 14
J	Ø 16
K	Ø 17
M	Ø 19
N	Ø 22
Z	Ø 24
Q	Ø 28
S	Ø 32
T	Ø 35
U	Ø 38

L	Clamp connection with shaft offset/long centering
C	Key connection
K	Key connection with shaft offset/long centering

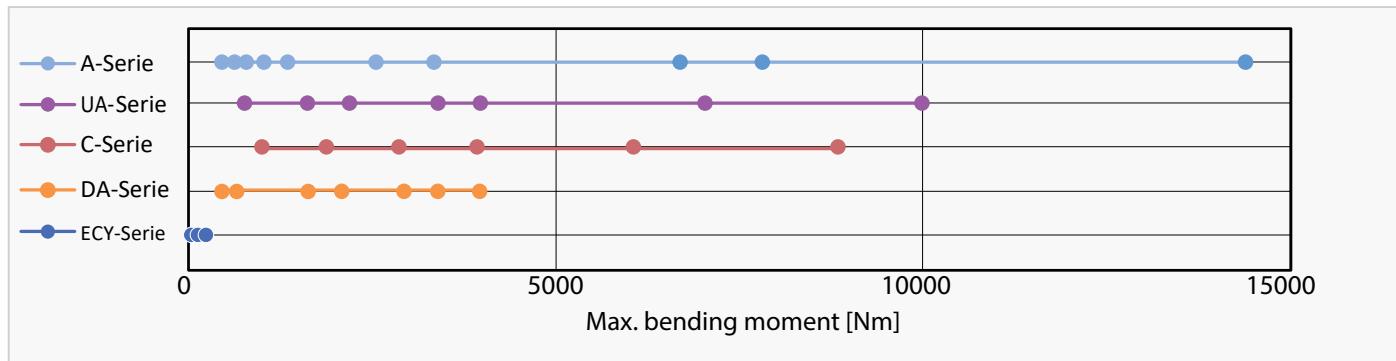

**Note** Other motor mounting dimensions / codes available on request.

### 3 Gearbox selection

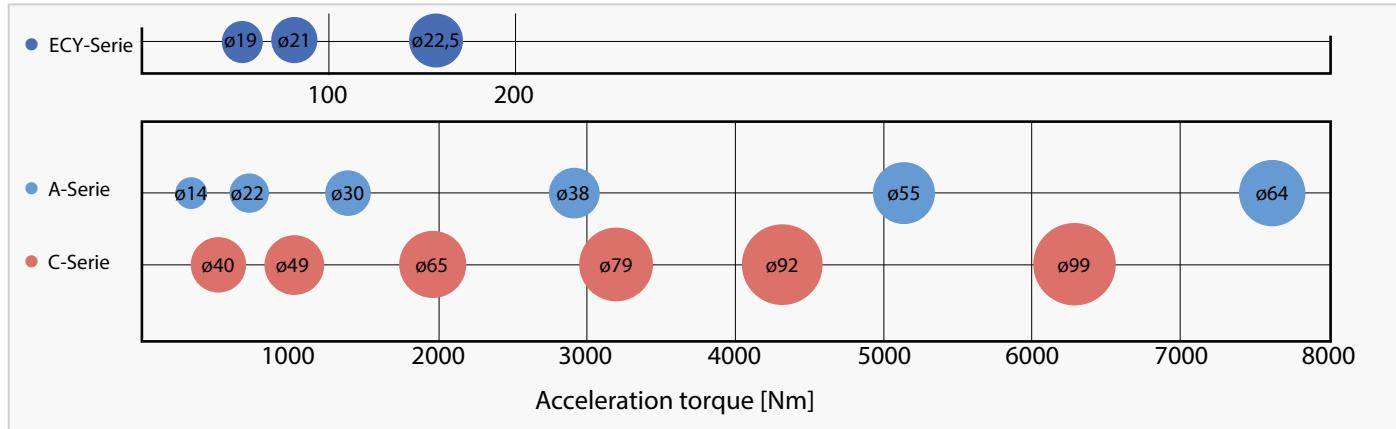

#### 3.1 Reduction ratio and acceleration torque

#### 3.2 Max. bending moment on the output flange

#### 3.3 Max. hollow shaft diameter

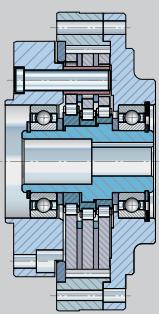

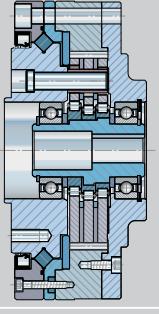

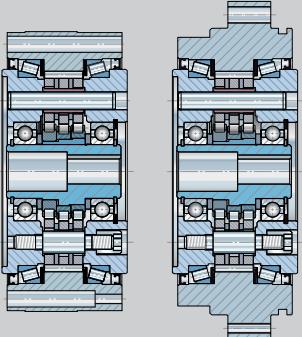

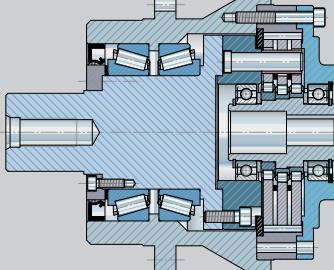

### 3.4 Reduction ratio and outer diameter

#### A Series

**Special feature:** The series offers a reduction kit with no bearing on the output side, as well as completely sealed variants and a gearbox with an output shaft instead of an output flange.

**Optional:** Available with motor adapter, customer-specific input shaft or output flange and other modifications.

	Model	Size	Available single-stage reduction ratios					Outer-Ø flange	Outer-Ø cylinder	Max. hollow shaftØ

### Calculation in load condition as per Fig. 6

Mean input speed	$n_{1m} = \left( \frac{t_A \cdot n_{1A} + t_R \cdot n_{1R} + t_B \cdot n_{1B}}{t_M} \right)$	(equation - 8)	
Mean reference torque	$T_{2v} = \left( \frac{t_A \cdot n_{1A} \cdot T_{2A}^{10/3} + t_R \cdot n_{1R} \cdot T_{2R}^{10/3} + t_B \cdot n_{1B} \cdot T_{2B}^{10/3}}{t_M \cdot n_{1m}} \right)^{3/10} \cdot B_{f2}$	(equation - 9)	
Max. permissible nominal output torque at mean input speed	$T_{2N} = T_{2N,600} \cdot \left( \frac{600}{n_{1m}} \right)^{3/10}$ For single-stage gearboxes	$T_{2N} = T_{2N,15} \cdot \left( \frac{15}{n_{2m}} \right)^{0.3}$ For double-stage gearboxes	(equation - 10)
ED %	$ED \% = \left( \frac{t_m}{t_c} \right) \cdot 100 [\%] = \left( \frac{t_c - t_p}{t_c} \right) \cdot 100 [\%]$	(equation - 11)	

$T_{2N,600}$ : Nominal output torque at an input speed of 600 min<sup>-1</sup> (Table X-3)

Please note the instructions on duty cycle in chapter 4.

If  $n_{1m} < 600$  min<sup>-1</sup>, the value in the table at input speed of 600 min<sup>-1</sup> applies for  $T_{2N}$ .

\* When selecting the motor, the input side breakaway torque (BTI) or no-load running torque (NLRT) must be taken into account.

### 3.6.1 Selection example

**Calculation example for Type F4C-C25-119 for the following specification:**

$T_{2A}$	= output side acceleration torque	600 Nm
$T_{2R}$	= output torque at constant speed	250 Nm
$T_{2B}$	= output side braking torque	400 Nm
$T_{2\max}$	= emergency stop torque	1700 Nm (1000 x over the entire lifetime)
$n_{1A}$	= mean input speed during start-up	1250 min <sup>-1</sup>
$n_{1R}$	= input speed during same-shape movement	2500 min <sup>-1</sup>
$n_{1B}$	= mean input speed during braking	1250 min <sup>-1</sup>
$t_A$	= start-up time	0.3 sec
$t_R$	= duration of the same-shape movement	3.0 sec
$t_B$	= time for braking	0.3 sec
$t_m$	= duration of the movement phase of a working cycle	3.6 sec
$t_p$	= duration of pause time	3.6 sec
$t_c$	= duration of a working cycle	7.2 sec
$F_{R1}$	= radial load on input shaft	driven by timing belt , minor shocks, $F_{R1} = 196$ N, with force application point 25 mm
$F_{R2}$	= radial load on the output shaft	Connection with gear, minor shocks, $F_{R2} = 4116$ N, 55 mm from the side of the flange

It was taken into account that this gearbox is used to operate a robot linkage at uniform load  
(see Table C14 service factor ( $B_F$ ), Page 92.

Mean input speed  $n_{1m} = \left( \frac{0.3 \cdot 1250 + 3.0 \cdot 2500 + 0.3 \cdot 1250}{3.6} \right) = 2292$  rpm

Mean reference torque  $T_{2v} = \left( \frac{0.3 \cdot 1250 \cdot 600^3 + 3.0 \cdot 2500 \cdot 250^3 + 0.3 \cdot 1250 \cdot 400^3}{3.6 \cdot 2292} \right)^{1/3} \cdot 1 = 300$  Nm

Max. permissible output torque  
at mean input speed  $T_{2N\max} = 568 \cdot \left( \frac{600}{2292} \right)^{0.3} = 380$  Nm  $\geq 300$  Nm  $\Rightarrow$  Type **F4C-C25-119**

Calculation of ED %  $ED \% = \left( \frac{3.6}{7.2} \right) \cdot 100 = 50\%$

○ Checking the maximum input speed  $n_1 = 2500 \text{ rpm} < n_{1\max} = 3500 \text{ rpm}$  (Table C-1)

○ Checking the mean input speed  $n_{1m} = 2292 \text{ min}^{-1} \text{ at 50% ED} < n_{1m\max} = 2900 \text{ min}^{-1} \text{ at 50% ED}$  (Table C-1)

○ Checking the peak torque during acceleration and braking  $T_{2A} = 600 \text{ Nm} < 1030 \text{ Nm}$  (Table C-2)

○ Checking the Emergency Stop torque  $T_{2\max} = 1700 \text{ Nm} < 2060 \text{ Nm}$  (Table C-2)

○ Max. permissible radial load on input shaft under consideration of correction factors

$$F_{R1\max} = F_{R1,600} \times \left( \frac{600}{n_{1m}} \right)^{1/3} = 841 \cdot \left( \frac{600}{2292} \right)^{1/3} = 538 \text{ N}$$

$$F_{R1} = \frac{F_{R1\max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} = \frac{538}{1.14 \cdot 1.25 \cdot 1.2} = 315 \text{ N} > 196 \text{ N}$$

(Table C11, Equation C-1, see Page 91 ff.)

○ Checking the max. permissible bending moment  $T_k \quad \ell_r = x - a + \ell_1 = 55 - 43.2 + 162 = 173.8 \text{ mm}$

Calculated dimension for bending moment  $\ell_r$

○ Correction factors are used to calculate the external bending moment

$$C_{f2} = 1.25 ; B_{f2} = 1.0$$

$$T_k = C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot \ell_r < T_{k\max}$$

$$T_{ke} = 1.25 \cdot 1.0 \cdot 4116 \cdot 173.8 \cdot 10^{-3}$$

$$T_{ke} = 891 \text{ Nm} < 1850 \text{ Nm}$$

### Selection/result

⇒ Type **F4C-C25-119** was selected as a result of the above evaluation.

## 4 Description of technical specifications for cycloidal gearboxes

### Stiffness and Lost Motion

If a torque is introduced in the output shaft when the input shaft is stationary, the relation between the distortion angle and the torque can be read off on the following hysteresis curve (Fig. 7).

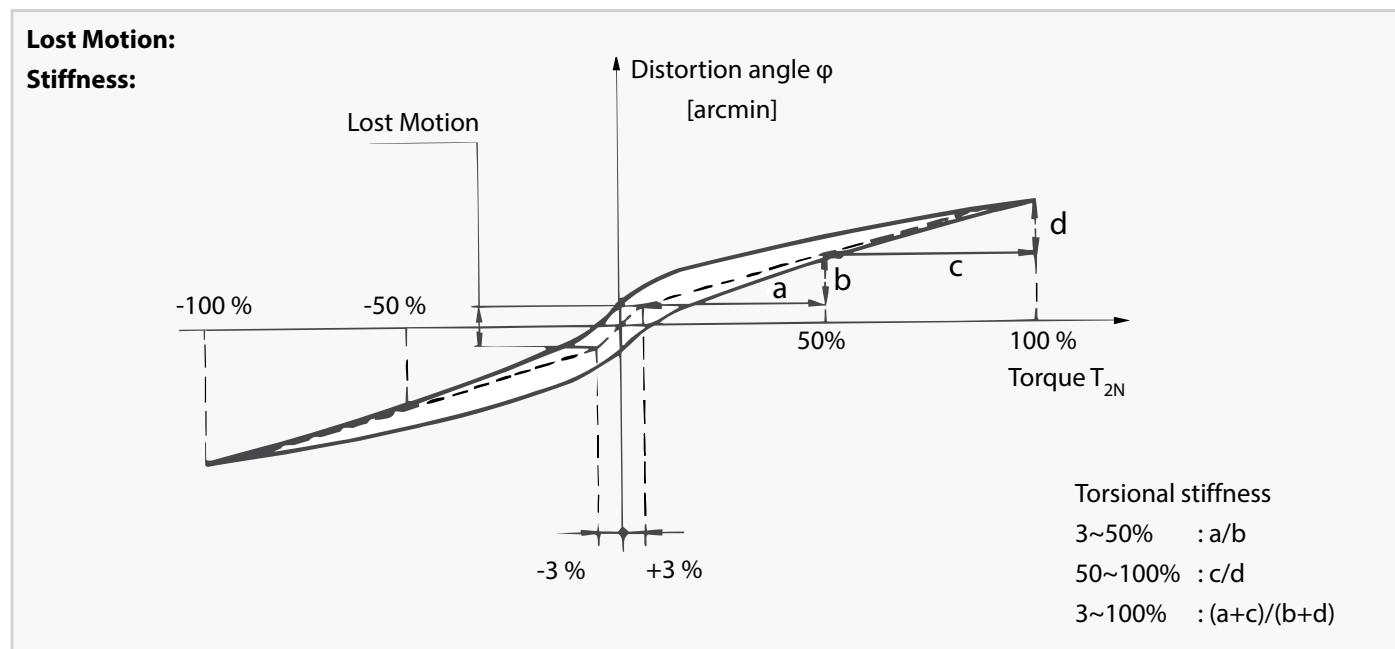

Fig. 7 Hysteresis curve

**Lost Motion:** Distortion angle at 3% of rated torque.

**Stiffness:** Inclination of a straight line connecting two points on the hysteresis curve.

The table value indicates the average torsional stiffness as a function of the nominal output torque.

**Note** arcmin means "angular minute"

$$1 \text{ arcmin} = \frac{1^\circ}{60}$$

### No-load running torque

No-load running torque must be applied to keep the gearbox in motion without load at the output. The information in the catalogue refers to average values which occur after the gearbox has been run in.

### Breakaway torque

Specifies the torque which is necessary to "break loose" the load-free gearbox from standstill, i.e. to start a rotational movement. This can take place on both the input (BTI) and the output side (BTO).

### Efficiency

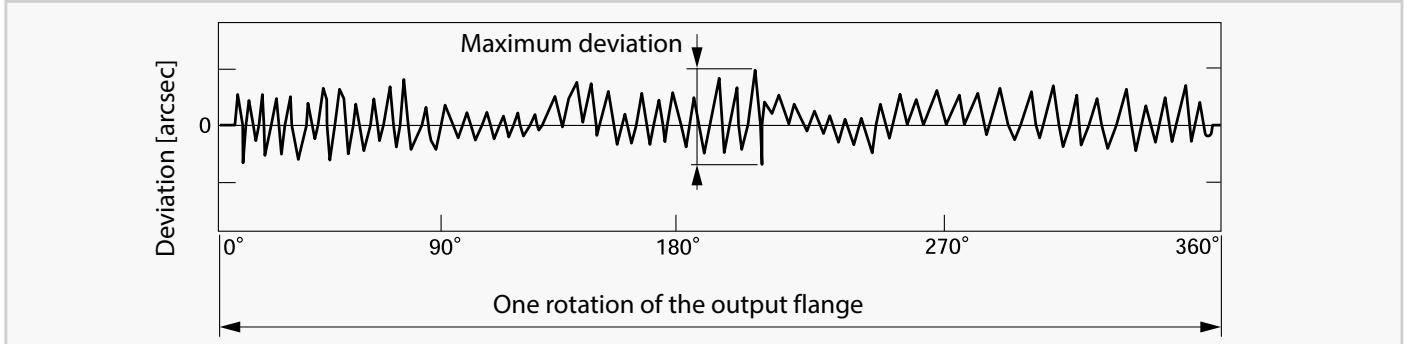

Efficiency varies according to speed, load torque, grease temperature, reduction ratio, gearbox size, etc.

The dependency between efficiency and input speed is shown in the figures relevant to the respective series, under measurement conditions with permissible output torque and stable grease temperature.

Variations in models and different reduction ratios are taken into account in the efficiency curve.

## Transmission error

The transmission error indicates the deviation of the actual rotation angle of the gearbox from the theoretical value. A defined input-side rotation of the gearbox divided by the reduction ratio gives the theoretical position of the output. The actual angle of rotation varies with a deviation of some angular seconds around this value.

**Fig. 8** Typical transmission error

**Note** arcsec means "angular second"

$$1 \text{ arcsec} = \frac{1^\circ}{3600}$$

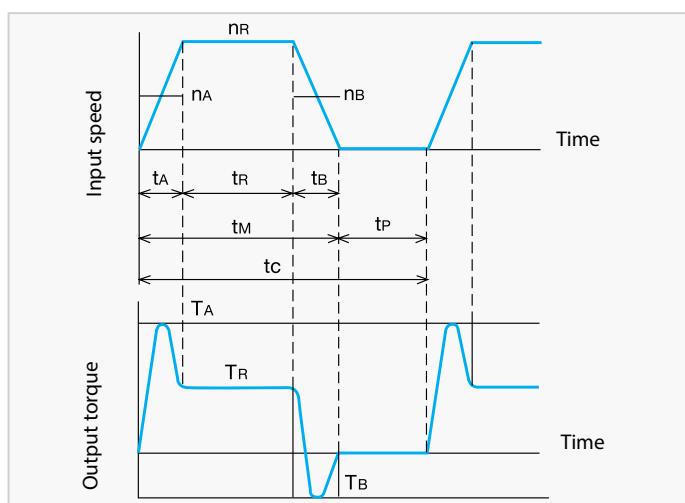

Applications for precision gearboxes generally differentiate between positioning and smooth traverse applications.

For positioning applications only the standstill positions of the gearbox play a role (e.g., tool magazine). Here, the transmission error is usually not important.

For smooth traverse applications, precision is important at every moment of movement (e.g. continuously welding robots). Here, a major transmission error can lead to unsatisfactory results.

Fine Cyclo reducers are ideally suited for both applications. Both single-stage and double-stage gearboxes show only minimal transmission errors. If maximum path accuracy is required, Fine Cyclo double-stage gearboxes provide additional advantages. Please contact Sumitomo Drive Technologies for assistance in choosing the correct gearbox.

## Load cycle

The load cycle ( $t_C$ ) reflects the sequence of movements in the application used. This typically consists of at least one acceleration phase ( $t_A$ ), one constant speed phase ( $t_R$ ), one deceleration ( $t_B$ ), and one pause of movement ( $t_P$ ).

## Duty cycle

The duty cycle is the percentage duration of the movement phase in proportion to the duration of the working cycle within a periodically repeating load cycle. In particular, the speed and duty cycle, as well as the torque and the installation situation (e.g. convection or external heat influence) determine the temperature development in the gearbox. Continuous operation of the gearbox at high speeds or duty cycles lead to overheating and destruction of the gearbox. To avoid this, the temperature of the ECY series gearbox housing should not exceed 60 °C during operation. For all other gearbox series described in this catalogue, the housing temperature should not exceed 70 °C during operation.

Therefore, a few basic principles must be taken into account.

The measuring basis is intermittent duty (S5 operation) on based on maximum 10 min. running time ( $t_o$ ), which includes a pause time. This means that it is necessary to check the permitted mean input speed  $n_{1m}$  according to the permitted nominal speed for %ED ( $n_{1m} < n_{1ED}$ ). For duty cycles of less than 50%, we recommend using 50 %ED nominal speeds, and for those greater than 50 %, 100 %ED nominal speeds, for checking  $n_{1m}$ .

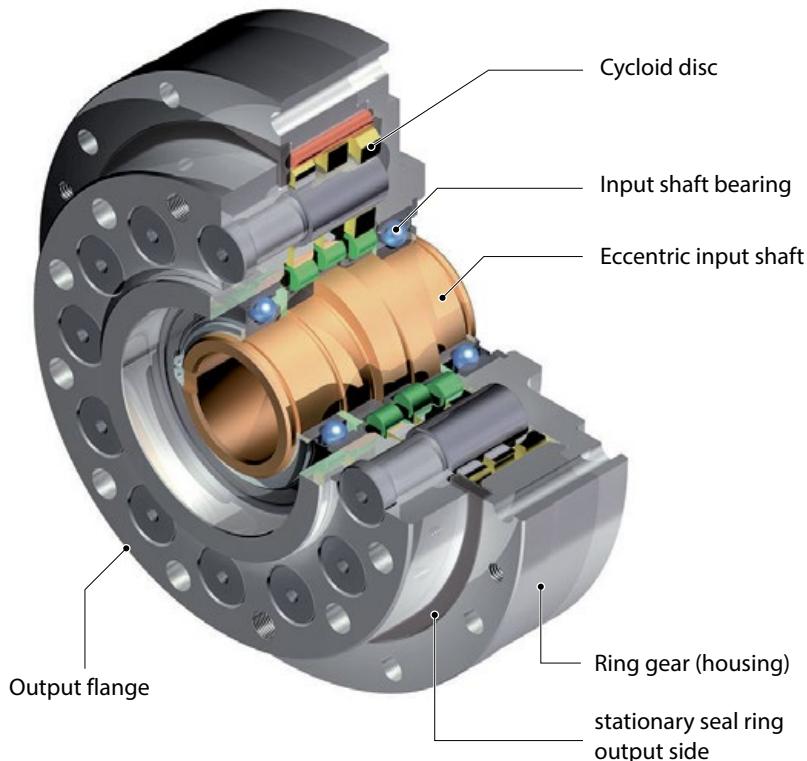

The following also applies:

If the duration of the movement phase of a working cycle  $t_M$  is greater than 10 minutes, in the case of continuous duty (S1) or if complex load cycles are performed, please consult Sumitomo Drive Technologies.

## 5 A Series

FC-A

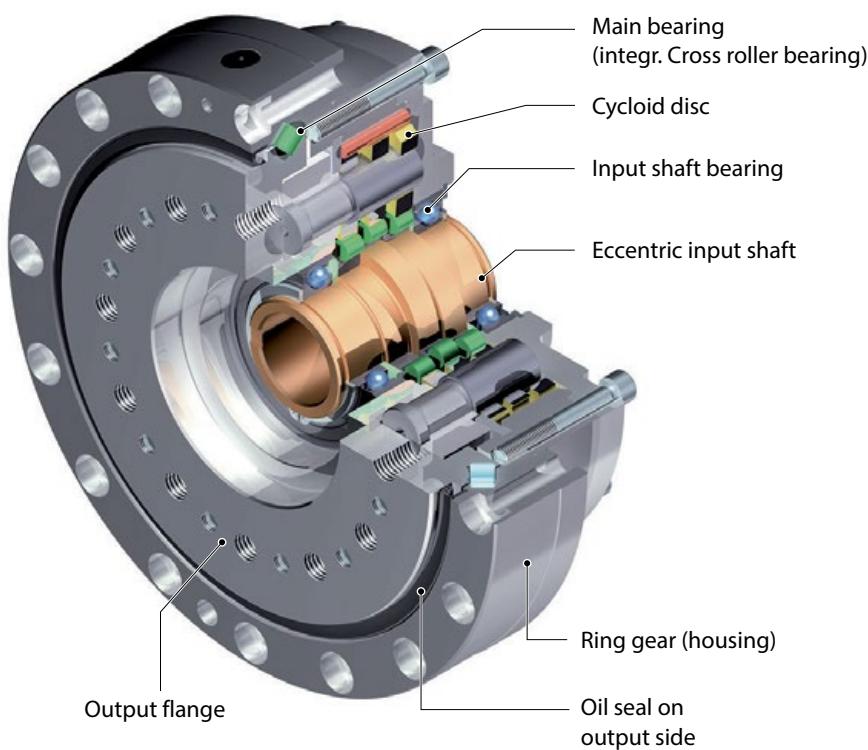

### Special feature:

User can use their own bearings, hollow shaft possible, compact reduction kit

- 6 sizes
- Ratios (single-stage) 29/59/89/119/179
- Can be customised to fit individual designs
- Smaller occupied space
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

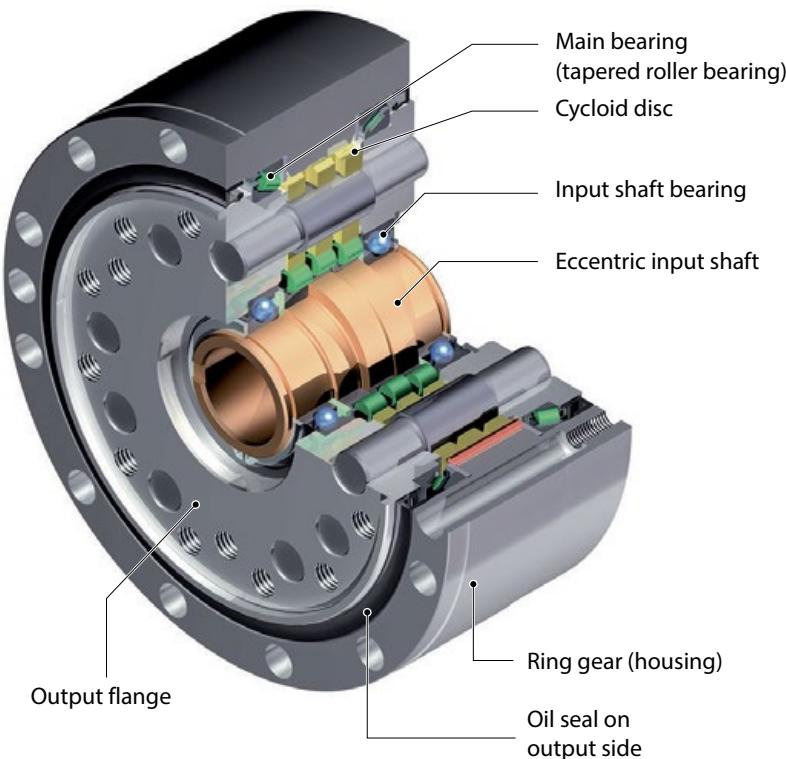

F1C-A

### Special feature:

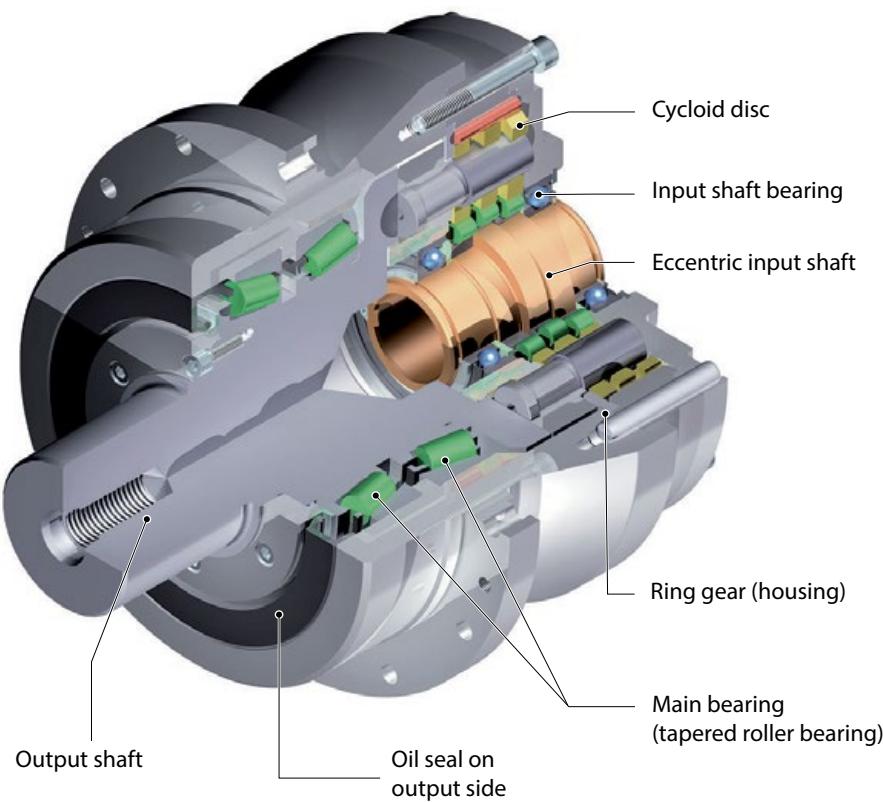

High stiffness, compact design

- 6 sizes
- Reduction ratios (single-stage) 29/59/89/119/179
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

**F2C-A****Special feature:**

Low noise, high stiffness, compact design

- 4 sizes
- Ratios (single-stage) 29/59/89/119/179
- Tapered roller bearings with high permissible tilting moments
- Nominal output torques up to 1830 Nm
- Acceleration torques up to 2910 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

**F3C-A****Special feature:**

Allows high radial forces

- 6 sizes
- Ratios (single-stage) 29/59/89/119/179
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

1.  $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.

The nominal output torque for speeds less than 5 min<sup>-1</sup> is equal to the value at 5 min<sup>-1</sup>.

The value for the maximum permissible input power is calculated from the nominal output torque at 100%. This value takes the efficiency of Fine Cyclo into consideration.

2.  $n_{1,\max}$  = maximum permissible input speed

However, it must be  $n_{1,m}$  (mean input speed) <  $n_{1,ED}$ .

3.  $n_{1,ED}$  = permissible input speed according to duty cycle

4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at 2 · 10<sup>7</sup> load cycles)

Permissible peak torque for normal start and stop procedures.

5.  $T_{2\max}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 times during the entire lifetime).

6. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,600} \left( \frac{600}{n_{1m}} \right)^{0.3} \quad T_{2N} : \text{Rated torque at output speed } n_{1m} \\ T_{2N,600} : \text{Rated torque at output speed } n_{1m} \text{ is } 600 \text{ min}^{-1}$$

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

1. T<sub>2N</sub> = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all input speeds.

The nominal output torque for speeds less than 600 min<sup>-1</sup> is equal to the value at 600 min<sup>-1</sup>.

The value for the maximum permissible input power is calculated from the nominal output torque at 100%.

This value takes the efficiency of Fine Cyclo into consideration.

2. n<sub>1max</sub> = maximum permissible input speed

However, it must be n<sub>1m</sub> (mean input speed) < n<sub>1ED</sub>.

3. n<sub>1ED</sub> = permissible input speed according to duty cycle

4. T<sub>2A</sub> = max. acceleration and braking torque (for fatigue strength at 2 · 10<sup>7</sup> load cycles)

Permissible peak torque for normal start and stop procedures.

5. T<sub>2max</sub> = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 times during the entire lifetime).

6. The rated torque T<sub>2N</sub> is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

T<sub>2N</sub> : Rated torque at input speed n<sub>1m</sub>  
T<sub>2N,600</sub> : Rated torque at input speed n<sub>1m</sub> is 600 min<sup>-1</sup>

**Table A5 Torsional stiffness**

(...) Values in brackets apply for F3C-A

$T_p$ : Test torque at input speed  $n_1 = 1500 \text{ min}^{-1}$

#### Calculation of the twist angle:

- 1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

- 2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".

Table values for stiffness are average values.

## 5.4 No-load running torque NLRT

No-load running torque for  $i = 59, 89.119$ , and  $179$

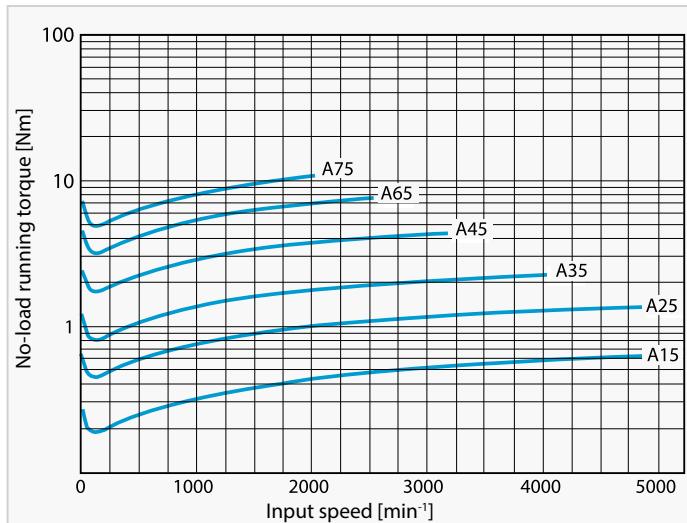

Fig. A1 Input side no-load running torque ( $i = 59-119$ )

No-load running torque for  $i = 29$

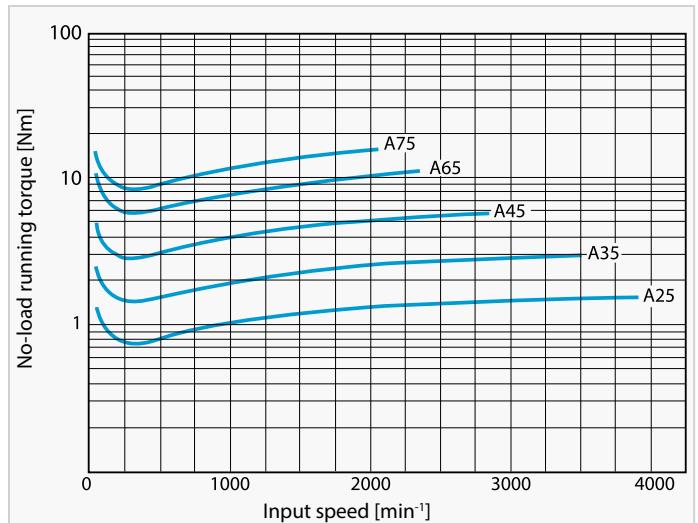

Fig. A2 Input side no-load running torque ( $i = 29$ )

- Note**
- Fig. A1 and Fig. A2 show the average no-load running torques after gearbox is run in (not new condition)
  - Table A6 shows the measuring conditions

## 5.5 Breakaway torque

### Breakaway torque on output side (BTO)

- Note**
- Table A7 shows the max. breakaway torque on the output side BTO. Fine Cyclo gearboxes are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  - Table A6 shows the measuring conditions

Ring gear housing temperature	approx. 30 °C
Precision during assembly	as per chapter 5.9.1, 5.10.1, 5.11.1, 5.12.1
Lubrication	Standard lubrication

Table A6 Measurement conditions

Size	Breakaway torque BTO [Nm]
<b>A15</b>	< 75
<b>A25</b>	< 180

	59	< 6.5
	89	< 5.5
	119	< 4.5

Table A8 Value of the breakaway torque on the input side (BTI)

## 5.6 Efficiency

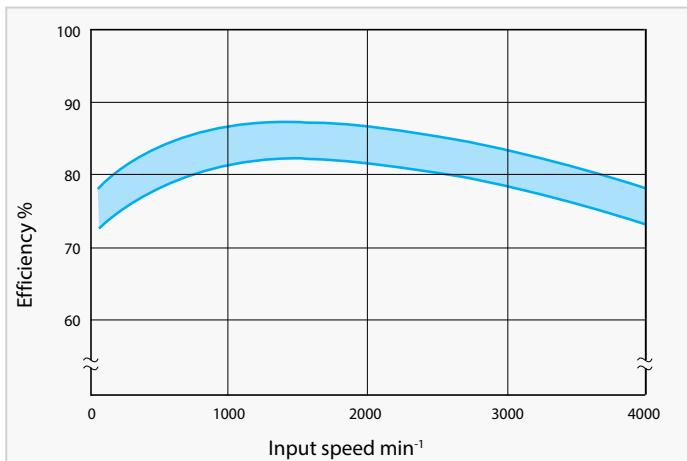

Fig. A3 Efficiency curve

Fig. A3 shows the correlation between efficiency and input speed. For further information, see "4 Description of technical specifications for cycloidal gearboxes" on page 20.

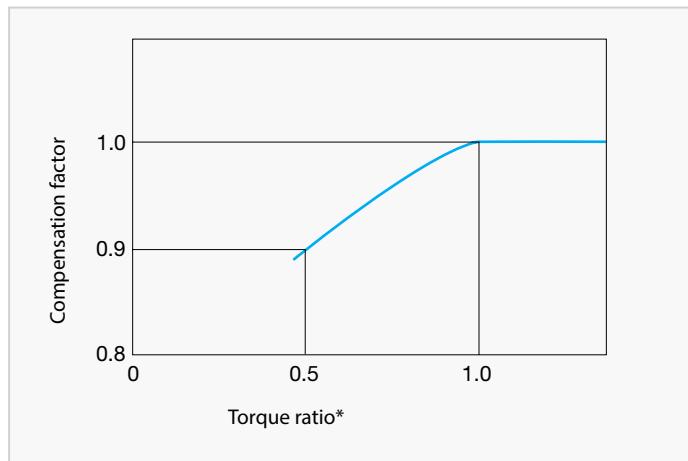

Fig. A4 Compensation curve for efficiency

$$*\text{Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

**Note**

1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. A4.
2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. A4).

## 5.7 Bearing loads

### 5.7.1 Maximum permissible radial and axial load on the input shaft

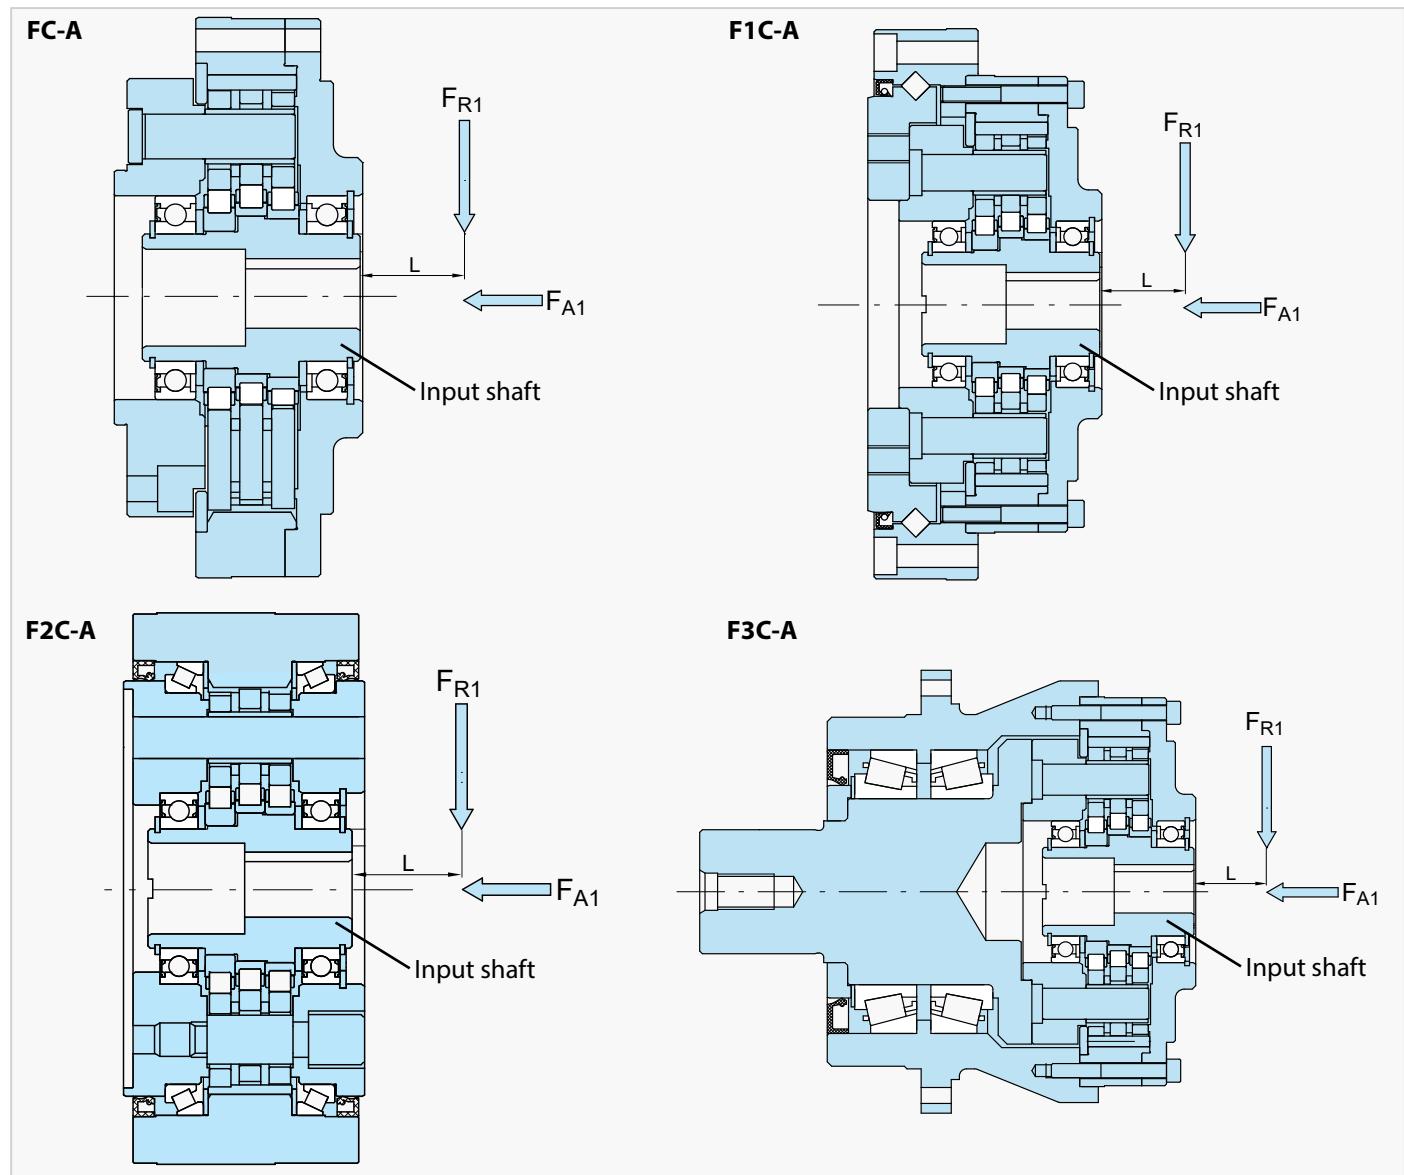

Fig. A5 Load position on input shaft

If a gear or timing belt pulley is mounted on the input shaft, the values for radial load and axial load should be equal to or less than the permissible values. The following equation is used to check whether the shaft load is permissible:

1. Input radial load  $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot r_0} \leq \frac{F_{R1\ max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} \quad [N] \quad (\text{Equation A- 1})$$

2. Input side axial load  $F_{A1}$

$$F_{A1} \leq \frac{F_{A1\ max}}{C_{f1} \cdot B_{f1}} \quad [N] \quad (\text{Equation A- 2})$$

3. When radial and axial loads co-exist

$$\left( \frac{F_{R1} \cdot L_{f1}}{F_{R1\ max}} + \frac{F_{A1}}{F_{A1\ max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation A- 3})$$

$F_{R1}$  = input side radial load [N]

$T_{2V}$  = reference torque on output shaft [Nm]

$r_0$  = pitch circle radius of sprocket, pinion, or timing belt pulley [mm]

$F_{R1\ max}$  = maximum permissible input side radial load [ N ] (Table A9)

$F_{A1}$  = input side axial load [N]

$F_{A1\ max}$  = max. permissible input side axial load [ N ] (Table A10)

$L_{f1}$  = load factor input (Table A11)

$C_{f1}$  = correction factor input (Table A12)

$B_{f1}$  = service factor input (Table A13)

$L$  = distance of radial load from front end on input side of the input shaft [mm] (Table A11)

$\eta$  = 0.8 (efficiency)

Size	Input speed $n_{1m}$ [min <sup>-1</sup> ]								
	4000	3000	2500	2000	1750	1500	1000	750	600

## 5.7.2 Main bearing

### Fine Cyclo - F1C-A

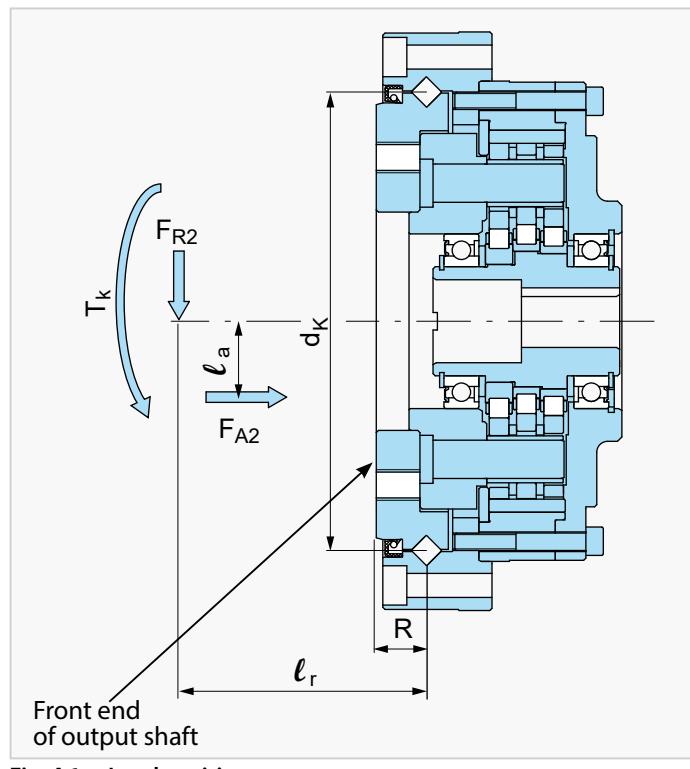

Fig. A6 Load position output

	Load factor	
	Radial load X_L	Axial load Y_L
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} \leq 1.5$	1	0.45
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} > 1.5$	0.67	0.67

$F_{A2}$  = output side axial load [N]

$F_{R2}$  = output side radial load [N]

$C_{f2}$  = correction factor output

$B_{f2}$  = service factor output

$d_k$  = Mean bearing diameter [mm]

$T_{k\max}$  = maximum permissible bending moment [Nm]

$T_k$  = bending moment [Nm] (Equation A-6), (Equation A-7)

$\varphi_1$  = tilt angle [arcmin]

$\Theta_1$  = moment stiffness main bearing [Nm/arcmin]

$T_{2v}$  = reference torque [Nm]

$d_0$  = pitch circle diameter of output element [mm]

$C$  = dynamic load rating

$C_0$  = static load rating

$P$  = equivalent load

For power transmission by means of pinion, timing belt, or similar:

$$F_{R2} = C_{f2} \cdot B_{f2} \cdot \frac{2 \cdot 10^3 \cdot T_{2v}}{d_0} \quad (\text{Equation A-9})$$

Size	$\Theta_1^*$ [Nm/arcmin]	$T_{k\max}$ [Nm]	$d_k$ [mm]	R [mm]	C [N]	$C_0$ [N]

Table A14 Specification cross roller bearings

#### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the output flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{Equation A-5})$$

Correction factor	$C_{f2}$
Chain	1
Gear or pinion	1.25
Timing belt	1.25
V-Belt	1.5

Table A15 Correction factor output  $C_{f2}$

Service factor	$B_{f2}$
Uniform load	1
Light impacts	1.2
Severe impacts	1.6

Table A16 Service factor output  $B_{f2}$

A dynamically equivalent load P on the bearing is calculated from these loads.

With the equivalent load P and the mean input speed  $n_{2m}$ , it is possible to test whether the output bearing achieves the desired lifetime  $L_{h10}$ .

$$P = X_L \left( F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k} \right) + Y_L \cdot F_{A2} \quad (\text{Equation A-10})$$

$$L_{h10} = \frac{10^6}{60 \cdot n_{2m}} \left( \frac{C}{P} \right)^{\frac{10}{3}} \quad (\text{Equation A-11})$$

\* Values for moment stiffness are reference values.

## Fine Cyclo - F2C(F)

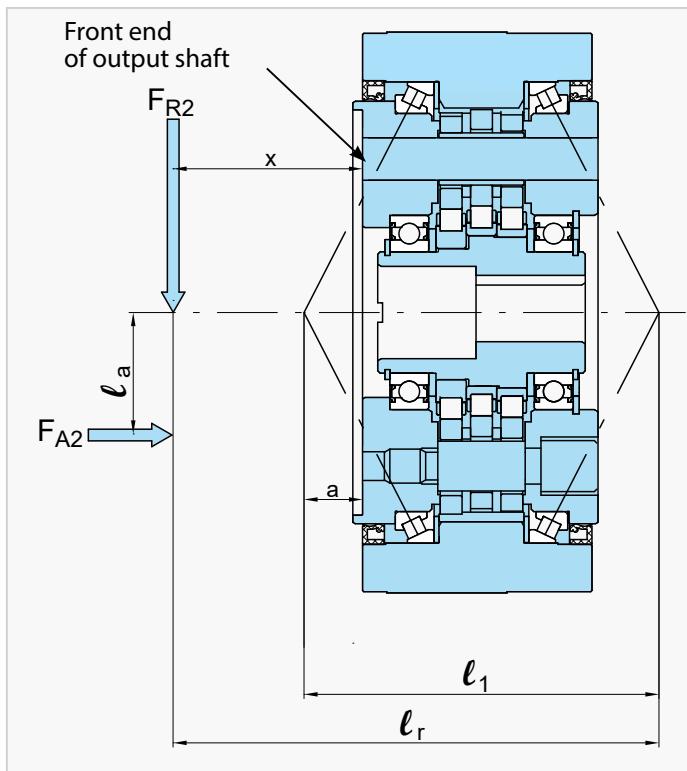

Fig. A7 Distance between the individual loading points

$$l_r = x - a + l_1 \quad (\text{Equation A- 4})$$

## 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{Equation A- 5})$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad (\text{Equation A- 6})$$

## 2. Max. permissible bending moment and max. permissible axial load

Check the equivalent bending moment and the equivalent axial load using equations A-6, A-7, A-8, and Fig. A8.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{kmax} \quad (\text{Equation A- 7})$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad (\text{Equation A- 8})$$

Size	Values of internal bearing distance	
	$\ell_1$ [mm]	a [mm]

### Fine Cyclo - F3C-A

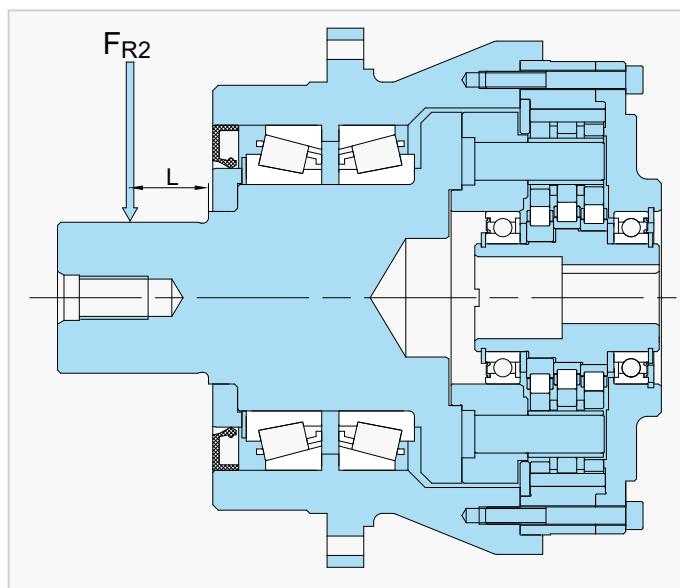

Fig. A9 Load position output

If the output shaft is fitted with a pinion or a disc, a force acts on the shaft. The following equation is used to check whether the shaft load is permissible.

Radial load  $F_{R2}$  [kN]

$$F_{R2} = \frac{T_{2V} \cdot L_f \cdot B_{f2} \cdot C_{f2}}{r_0} \leq F_{R2\text{per}} \quad (\text{Equation A-12})$$

Radial load

$F_{R2\text{per}}$  = permissible radial load [kN]

$T_{2V}$  = reference torque [Nm]

$L_f$  = load factor

$B_f$  = service factor

$C_f$  = correction factor

$r_0$  = pitch circle radius of the pinion [mm]

## 5.9 Model FC-A

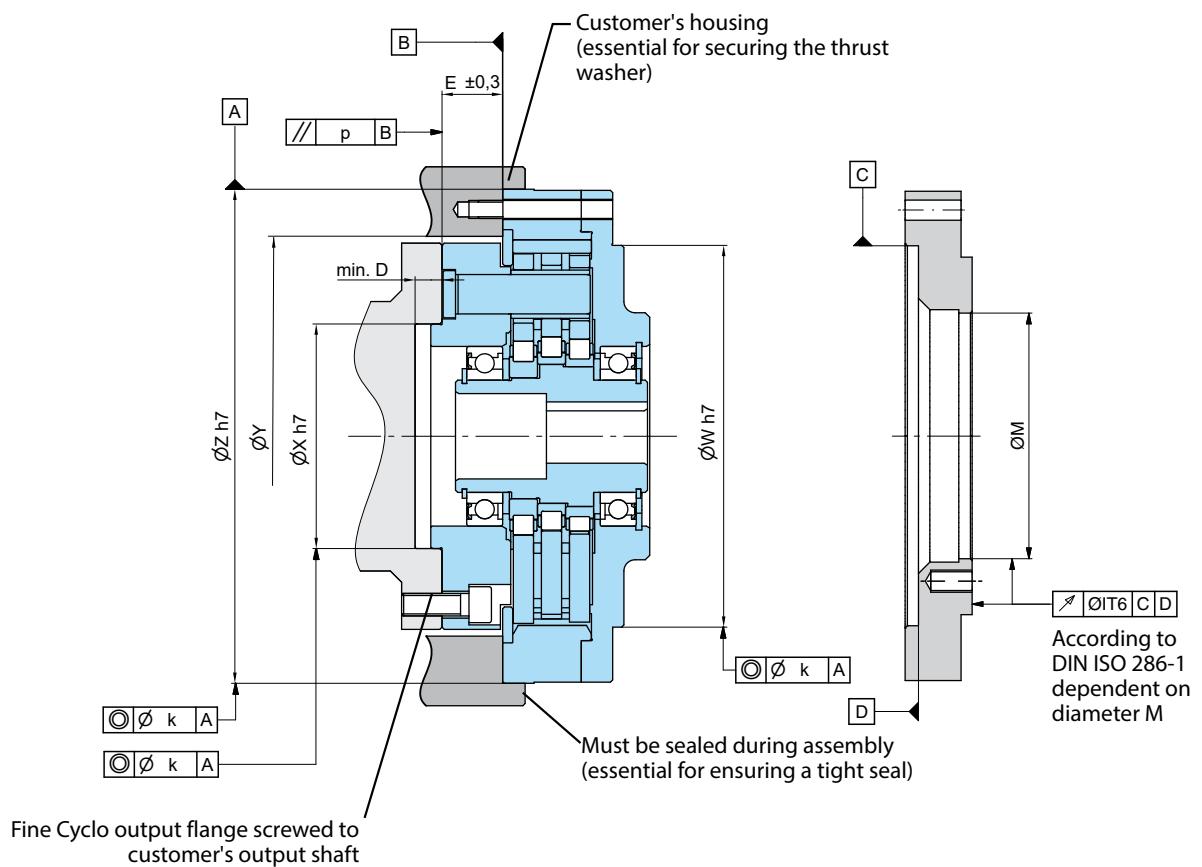

### 5.9.1 Assembly tolerances

In order for the thrust washer to be held by the customer's housing, the internal diameter B must not exceed the specified values. The depth of the output shaft spigot must be equal to or less than dimension "D" to prevent jamming the output flange. Furthermore, dimension "E" must be adhered to. The recommended accuracy of the assembly part (housing and output shaft) must lie within coaxiality "k" and parallelism "p".

The recommended diameters of the centerings of the housing, output shaft, and input side flange are shown schematically below.

To ensure the function, lifetime, and characteristics of the gearbox, the radial run-out of the shaft ends, the coaxiality and the axial run-out of the fastening surface as per EN 50347:2001 are sufficient.

When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Size	$\varnothing M$	$\varnothing X$	$\varnothing Y \text{ min.}$	$\varnothing Y \text{ max.}$	$\varnothing Z$	$\varnothing W$	D	E	k	p
A15		45	89	90	115	85	5	15.5	0.030	0.025

A75		150	239	262	310	235	8	38	0.030	0.070

Table A28 (Dimensions in mm)

## 5.9.2 Tightening torque and maximum permissible transmittable torque for bolts

The permissible transmitted torque for bolts and the number, size, and tightening torque for fastening the output side flange and the ring gear housing are listed in Table A29. In the event of an Emergency Stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

The safety instructions for installation in the operating manual must also be observed.

Size	Output flange bolts		Bolts for ring gear (housing)		Max. permissible transmittable torque for bolts [Nm]
	Number and size of bolts	Tightening torque [Nm]	Number and size of bolts	Tightening torque [Nm]	
<b>A15</b>	12 × M5	9.2	8 × M5	9.2	470

<b>A65</b>	12 × M12	135	12 × M10	77	7000
<b>A75</b>	12 × M12	135	12 × M10	77	8000

Table A29

- Bolting:** Use metric hexagon socket screws (DIN 4762, strength category 12.9).
- Countermeasure for bolts loosening:** Use adhesives (Loctite 243).

## 5.9.3 Additional dowel pinning for FC-A

In cases where higher limit torques (please also see Table A4) than in Table A29 are to be expected or if the bolt tightening torque cannot be correctly observed, additional dowel pinning is recommended. See Table A30 and Fig. A10.

In all cases, the values specified in the catalogue always apply with regard to the maximum permitted gearbox torques.

FC-A	Slow-speed shaft flange

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

1.  $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.

The nominal output torque for speeds less than 5 min $^{-1}$  is equal to the value at 5 min $^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 100%.

This value takes the efficiency of Fine Cyclo into consideration.

2.  $n_{1\text{max}}$  = maximum permissible input speed

However, it must be  $n_{1m}$  (mean input speed) <  $n_{1\text{ED}}$ .

3.  $n_{1\text{ED}}$  = permissible input speed according to duty cycle

4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.

5.  $T_{2\text{max}}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 times during the entire lifetime).

6. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N, 600} \left( \frac{600}{n_{1m}} \right)^{0.3} \quad T_{2N} : \text{Rated torque at output speed } n_{1m} \\ T_{2N, 600} : \text{Rated torque at output speed } n_{1m} \text{ is } 600 \text{ min}^{-1}$$

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

1.  $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all input speeds.

The nominal output torque for speeds less than 600 min $^{-1}$  is equal to the value at 600 min $^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 100%.

This value takes the efficiency of Fine Cyclo into consideration.

2.  $n_{1\text{max}}$  = maximum permissible input speed

However, it must be  $n_{1m}$  (mean input speed)  $< n_{1\text{ED}}$ .

3.  $n_{1\text{ED}}$  = permissible input speed according to duty cycle

4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.

5.  $T_{2\text{max}}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 times during the entire lifetime).

6. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at input speed  $n_{1m}$   
 $T_{2N,600}$  : Rated torque at input speed  $n_{1m}$  is 600 min $^{-1}$

Table A5 Torsional stiffness

 $T_p$ : Test torque at input speed  $n_1 = 1500 \text{ min}^{-1}$ 

#### Calculation of the twist angle:

- 1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

**Note** arcmin means "angular minute".  
Table values for stiffness are average values.

- 2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

## 6.4 No-load running torque NLRT

### No-load running torque

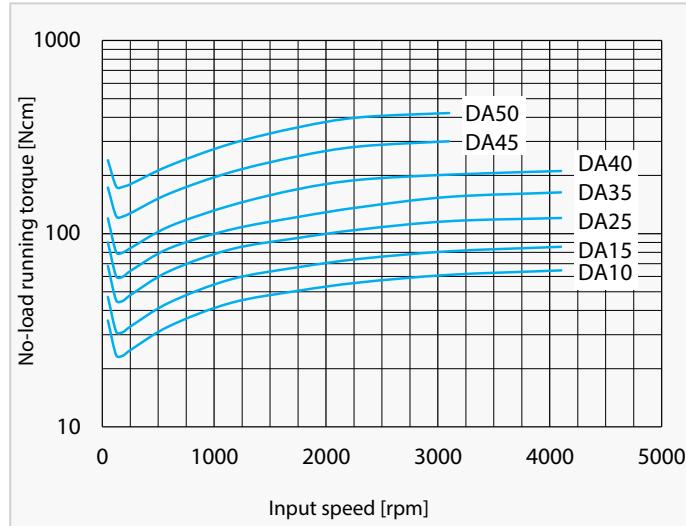

Fig. A1 Input side no-load running torque

### Note

- Fig. DA-1 shows the average no-load running torque after gearbox is run in (not factory-new condition)
- Table DA-6 shows the measuring conditions

## 6.5 Breakaway torque

### Breakaway torque on output side (BTO)

#### Note

- Table DA-7 shows the max. breakaway torque on the output side BTO. Fine Cyclo gearboxes are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
- Table DA-6 shows the measuring conditions

Ring gear housing temperature	approx. 30 °C
Precision during assembly	as per chapter 6.8.1
Lubrication	Standard lubrication

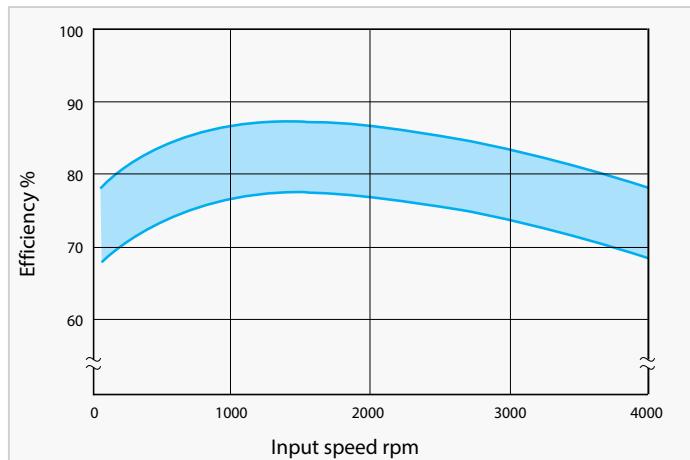

Fig. A2 Efficiency curve

Fig. DA-2 shows the correlation between efficiency and input speed. For further information, see "9 Description of technical specifications for cycloidal gearboxes" on page 20.

- Note**
- The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. DA-3.
  - When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. DA-3).

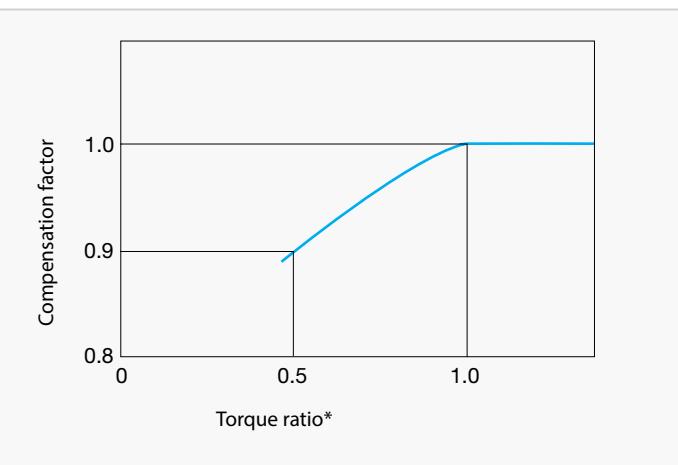

Fig. A3 Compensation curve for efficiency

$$\text{* Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

## 6.7 Bearing loads

### 6.7.1 Maximum permissible radial and axial load on the input shaft

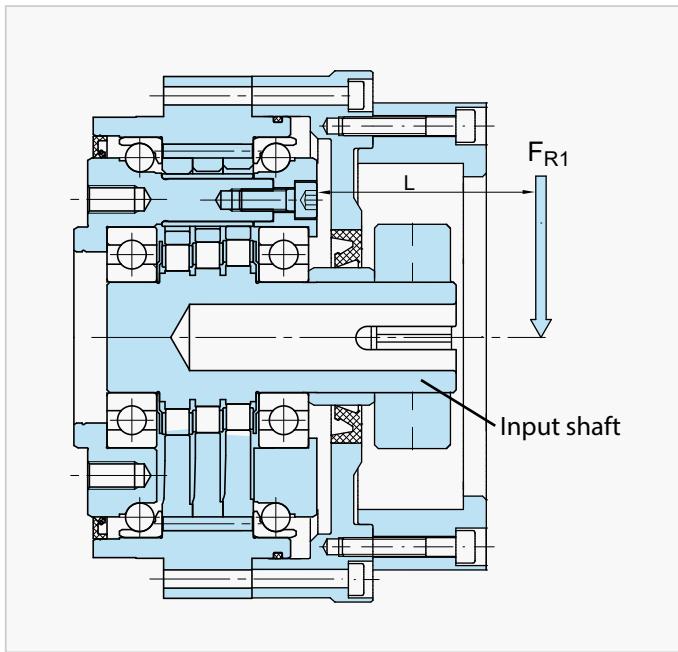

Fig. A4 Load position on input shaft

	[mm]	Load factor input $L_{f1}$					
		DA10	DA15	DA25	DA35	DA40	DA45
<b>L</b>	<b>10</b>	1.00	0.91	0.87	0.85		
	<b>15</b>	1.50	0.99	0.94	0.91	0.91	0.88
	<b>20</b>	2.00	1.25	1.00	0.98	0.97	0.93
	<b>25</b>	2.50	1.56	1.25	1.14	1.09	0.98

<b><math>\ell_1</math></b>	<b>If:</b> <b><math>L_{f1} = 1</math></b>	10	16	20	22	23	27
	<b>a</b>	0.075	0.072	0.063	0.061	0.055	0.052

Table A10 Load factor input  $L_{f1}$

$L$  = Distance from input side input shaft front end

$$L \geq \ell_1 \quad L_{f1} = L/\ell_1$$

$$L < \ell_1 \quad L_{f1} = 1.0 - a/5 \times (\ell_1 - L)$$

If a gear or timing belt pulley is mounted on the input shaft, the values for radial load and axial load should be equal to or less than the permissible values. The following equation is used to check whether the shaft load is permissible:

1. Input radial load  $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot i \cdot r_0} \leq \frac{F_{R1\max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation DA-1})$$

2. Input side axial load  $F_{A1}$

$$F_{A1} \leq \frac{F_{A1\max}}{C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation DA-2})$$

3. When radial and axial loads co-exist

$$\left( \frac{F_{R1} \cdot L_{f1}}{F_{R1\max}} + \frac{F_{A1}}{F_{A1\max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation DA-3})$$

$F_{R1}$  = input side radial load [N]

$T_{2V}$  = reference torque on output shaft [Nm]

$r_0$  = pitch circle radius of sprocket, pinion, or timing belt pulley [mm]

$F_{R1\max}$  = maximum permissible input side radial load [ N ] (Table DA-12)

$F_{A1}$  = input side axial load [N]

$F_{A1\max}$  = max. permissible input side axial load [N] (Table DA-10)

$L_{f1}$  = load factor input (Table DA-10)

$C_{f1}$  = correction factor input (Table DA-9)

$B_{f1}$  = service factor input (Table DA-11)

$L$  = distance of radial load from front end on input side of the input shaft [mm] (Table DA-10)

$\eta$  = 0.8 (efficiency)

## 6.7.2 Main bearing

### Fine Cyclo - F4C-DA

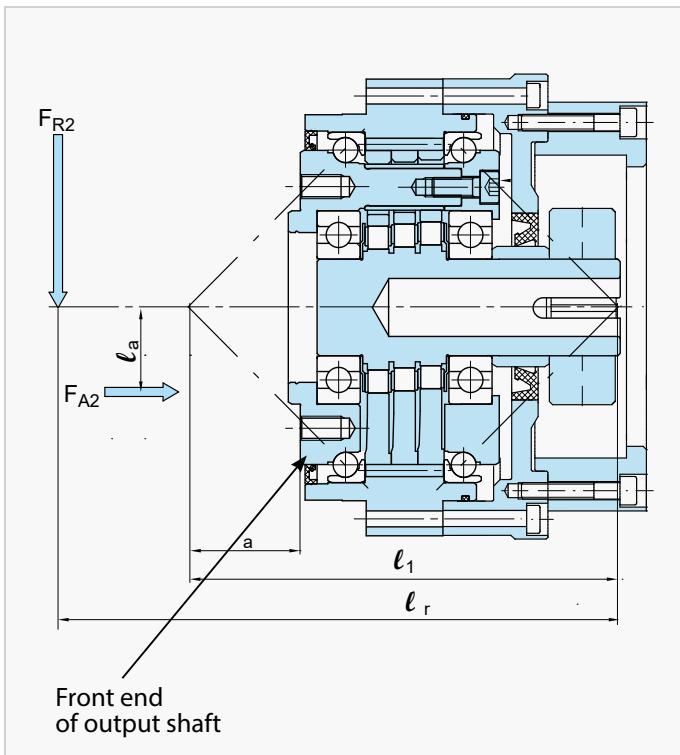

Fig. A5 Load position output

#### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{equation DA-5})$$

External bending moment  $T_k$

$$T_k = 10^3 \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad (\text{equation DA-6})$$

#### 2. Max. permissible bending moment and max. permissible axial load

Check the equivalent bending moment and the equivalent axial load using the equations DA-6, DA-7, DA-8, and Fig. DA-6.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{kmax} \quad (\text{Equation DA-7})$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad (\text{Equation DA-8})$$

Size	Values of internal bearing distance

## 6.8 Assembly specifications and tolerances

### 6.8.1 Assembly tolerances

To ensure the function, lifetime, and characteristics of the gearbox, the radial run-out of the shaft ends, the coaxiality and the axial run-out of the fastening surface as per EN 50347:2001 are sufficient. When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Table A20 (Dimensions in mm)

- Take the installation situation in position **(C)** into consideration on the input side.
- Take the installation situation at the output flange in position **(B)** and at the customer's housing in position **(A)** into consideration.

Installation example 1

Installation example 2

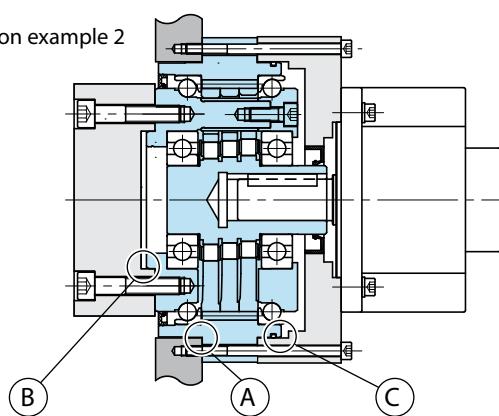

Fig. A7 Installation example

### 6.8.2 Tightening torque and maximum permissible transmittable torque for bolts

The permissible transmitted torque for bolts and the number, size, and tightening torque for fastening the output side flange and the ring gear housing are listed in Table DA-21. In the event of an Emergency Stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

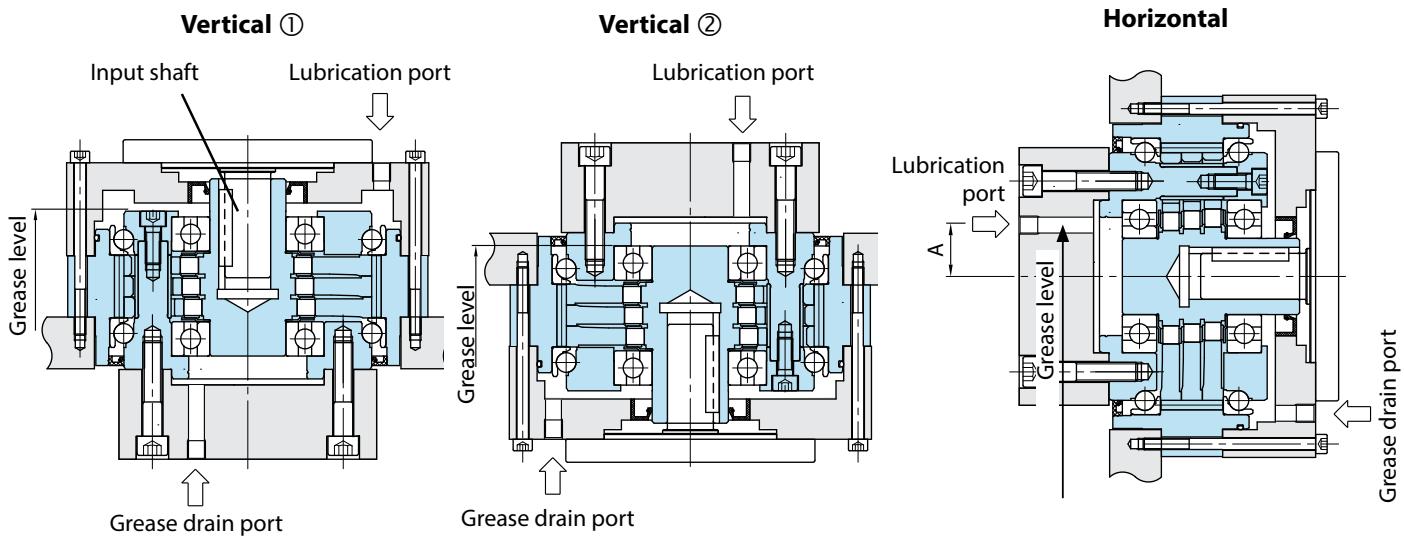

The safety instructions for installation in the operating manual must also be observed.

Size	Output flange bolts			Bolts for ring gear (housing)		
	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]

Table A21

- **Bolting:** Use metric hexagon socket screws (DIN 4762, strength category 12.9).
- **Countermeasure for bolts loosening:** Use adhesives (Loctite 243).

### 6.8.3 Lubrication

- For gearboxes that are not sealed, delivery does not include lubricant (grease filling). Upon receipt, the customer must therefore fill it with the appropriate amount (Table DA-23) of the recommended grease (Table DA-22).
- Use the quantity quoted in Table DA-14 DA-23 as an approximate value; check the grease level.
- Fit the lubrication port and the grease drain on the output side. (See "A" and Table DA-23)
- When adding grease for the first time, use the lower opening to ensure grease circulation.
- Reconditioning is recommended after 20,000 operating hours, but at least every 3-5 years.
- The lifetime of the gearbox can be increased by returning it to the factory for overhauling and regreasing.
- DA-Modular as per the standard catalogue version are designed for lubrication in any mounting position.

## 7 C Series

F4C(F)-C

F2CF-C

### Special feature:

The large diameter of the hollow shaft allows for effective use of space for the cable or media

- 6 sizes
- Ratios (single-stage) 29/59/89/119
- Nominal output torques up to 4328 Nm
- Acceleration torques up to 6278 Nm
- Hollow shaft diameter from 40 to 99 mm
- Completely sealed and maintenance-free
- Lost Motion < 1

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

1.  $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.  
The nominal output torque for speeds less than 5 min $^{-1}$  is equal to the value at 5 min $^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.

2.  $n_{1\text{max}}$  = maximum permissible input speed

However, it must be  $n_{1m}$  (mean input speed) <  $n_{1\text{ED}}^*$ .

3.  $n_{1\text{ED}}$  = permissible input speed according to duty cycle

4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.

5.  $T_{2\text{max}}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 times during the entire lifetime).

6. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N, 600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at input speed  $n_{1m}$   
 $T_{2N, 600}$  : Rated torque at input speed  $n_{1m}$  is 600 min $^{-1}$

4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.

5.  $T_{2\text{max}}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 times during the entire lifetime).

6. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N, 600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at input speed  $n_{1m}$   
 $T_{2N, 600}$  : Rated torque at input speed  $n_{1m}$  is 600 min $^{-1}$

### 7.3 Stiffness and Lost Motion

Size	i	Test torque $T_p$ [Nm]	Lost Motion		Torsional stiffness 3% - 50% $T_p$ [Nm/arcmin]	Torsional stiffness 3% - 100% $T_p$ [Nm/arcmin]	Torsional stiffness 50% - 100% $T_p$ [Nm/arcmin]
			Lost Motion	Domain of definition [Nm]			
C15	29	$\pm 215$	$< 1 \text{ arcmin}$	$\pm 6.5$	40	69	77
	59			$\pm 12.4$	71	115	128
	89			$\pm 23.5$	200	259	294
C25	59	$\pm 412$	$< 1 \text{ arcmin}$	$\pm 38.3$	353	404	491
	89			$\pm 58.9$	588	635	687

	89						
	119						

Table C5 Torsional stiffness

$T_p$ : Test torque at input speed  $n_i = 1750 \text{ min}^{-1}$

#### Calculation of the twist angle:

- 1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

- 2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".

Table values for stiffness are average values.

## 7.4 No-load running torque NLRT

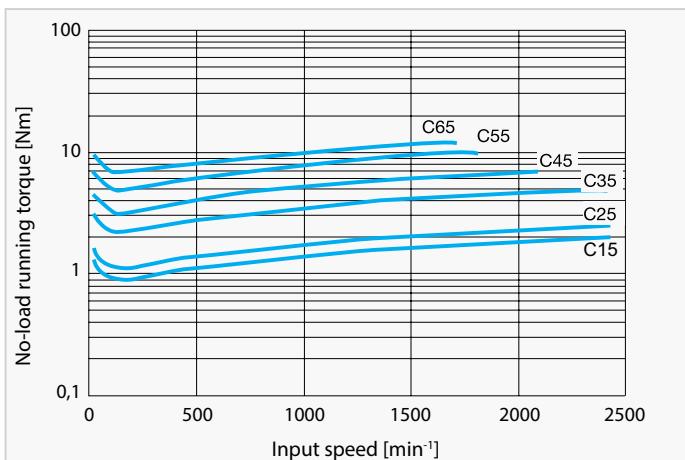

Fig. C1 Input side no-load running torque

**Note**

- Fig. C1 shows the average no-load running torque after gearbox is run in (not factory-new condition).
- Table C6 shows the measuring conditions.

Ring gear housing temperature	approx. 30 °C
Precision during assembly	as per 7.8.1
Lubrication	Standard lubrication

Table C6 Measurement conditions

## 7.5 Breakaway torque

Indicates the necessary torque for breakaway of the gearbox on the input or output side, after stop without output side load.

### Breakaway torque on output side (BTO)

**Note**

- Table C8 shows the max. breakaway torque on the output side BTO. Fine Cyclo gearboxes are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
- Table C7 shows the measuring conditions

Precision during assembly	as per 7.8.1
Lubrication	Standard lubrication

Table C7 Measurement conditions

Size	i	Breakaway torque BTO [Nm]
<b>C15</b>	29	< 70
	59	< 70
	89	< 128

	89	< 1000
	119	< 2100

Table C8 Value of the breakaway torque on the output side (BTO)

### Breakaway torque on input side (BTI)

**Note**

- Table C9 shows the max. breakaway torque BTI on the input side. BTI is defined as the maximum value (factory-new condition) which steadily decreases during the lifetime.
- Table C7 shows the measuring conditions

Size	Breakaway torque BTI [Nm]
<b>C15</b>	< 2.4
<b>C25</b>	< 3.5
<b>C35</b>	< 4.5
<b>C45</b>	< 6.5
<b>C55</b>	< 9.0
<b>C65</b>	< 11.5

Table C9 Value of the breakaway torque on the input side (BTI)

## 7.6 Efficiency

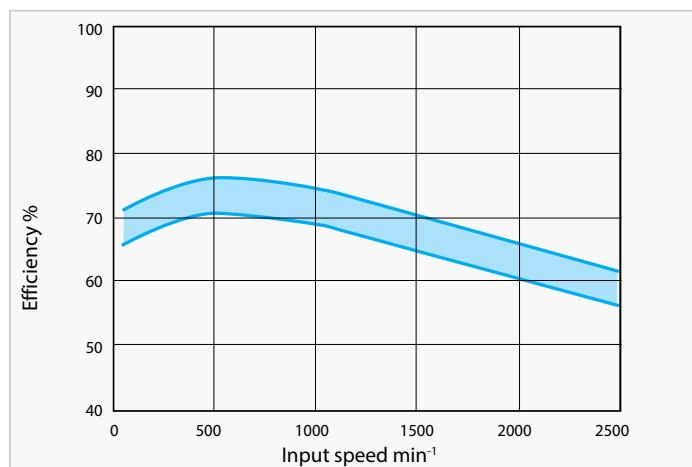

Fig. C2a Efficiency curve (size C15-C45)

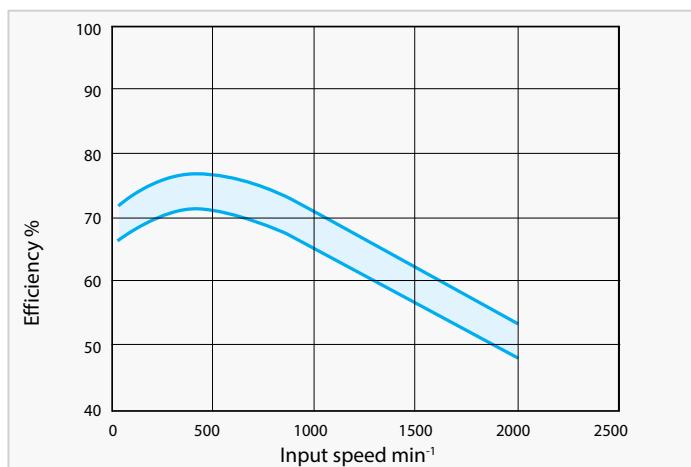

Fig. C2b Efficiency curve (size C55-C65)

Fig. C2a and Fig. C2b show the correlation between efficiency and input speed. Further information see "9 Description of technical specifications for cycloidal gearboxes" on page 20.

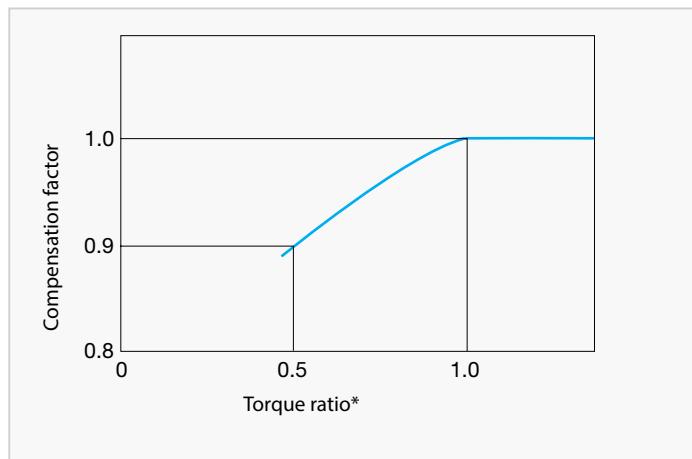

Fig. C3 Compensation curve for efficiency

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

**Note**

1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. C3.
2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. C3).

$$*\text{Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

## 7.7 Bearing loads

### 7.7.1 Maximum permissible radial and axial load on the input shaft

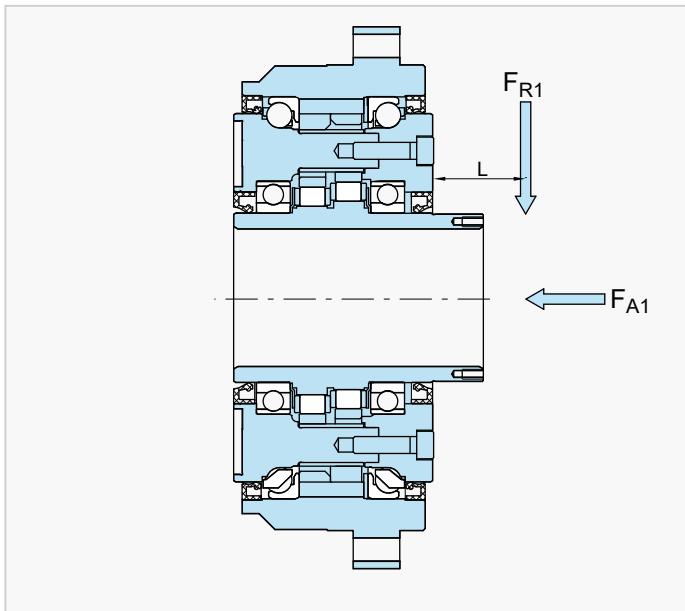

Fig. C4 Load position on input shaft

If a gear or timing belt pulley is mounted on the input shaft, the values for radial load and axial load should be equal to or less than the permissible values. The following equation is used to check whether the shaft load is permissible:

#### 1. Input radial load $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot i \cdot r_0} \leq \frac{F_{R1\ max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} \quad [N] \quad (\text{Equation C-1})$$

#### 2. Input side axial load $F_{A1}$

$$F_{A1} \leq \frac{F_{A1\ max}}{C_{f1} \cdot B_{f1}} \quad [N] \quad (\text{Equation C-2})$$

#### 3. When radial and axial loads co-exist

$$\left( \frac{F_{R1}}{F_{R1\ max}} + \frac{F_{A1}}{F_{A1\ max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation C-3})$$

L [mm]	Load factor input $L_{f1}$					
	Size					
C15	C25	C35	C45	C55	C65	
5	0.79	0.8	0.76	0.75	0.73	0.73
10	0.86	0.86	0.81	0.79	0.77	0.77
15	0.93	0.92	0.86	0.83	0.8	0.8

## 7.7.2 Main bearing

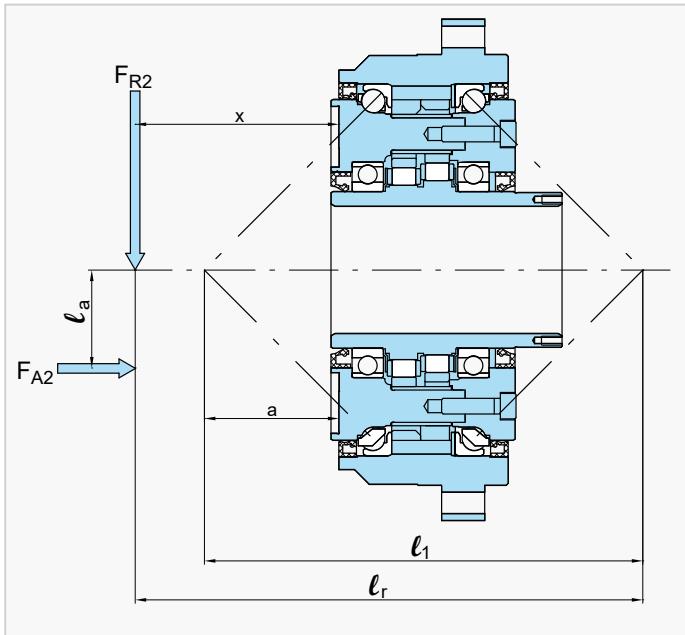

Fig. C5 Distance between the individual loading points

$$l_r = x - a + l_1 \quad (\text{Equation C-4})$$

### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{Equation C-5})$$

External bending moment T<sub>k</sub>

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad (\text{equation C-6})$$

### 2. Max. permissible bending moment and max. permissible axial load.

Check the external bending moment and the external axial load using equations C-6, C-7, and C-8.

Equivalent bending moment T<sub>ke</sub>

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{kmax} \quad (\text{Equation C-7})$$

Equivalent axial load F<sub>A2e</sub> at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad (\text{Equation C-8})$$

Size	Values of internal bearing distance

## 7.8 Assembly specifications and tolerances

### 7.8.1 Assembly tolerances

Fits for assembly of input and output parts (timing belt, disc, gear, etc.) are shown schematically in the following figure. Use the diameters and tolerances shown in the table below.

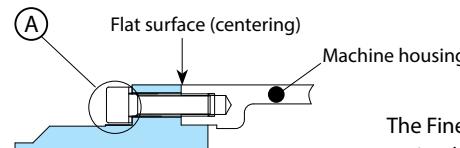

Size	$\phi W$	$\phi X$	$\phi Y$	$\phi Z$
<b>C15</b>	137	49.5	71 h7	137
<b>C25</b>	185	59	133 H7	185
<b>C35</b>	220	79	167 H7	220
<b>C45</b>	250	94	192 H7	250
<b>C55</b>	284	109	218 H7	284
<b>C65</b>	320	119	245 H7	320

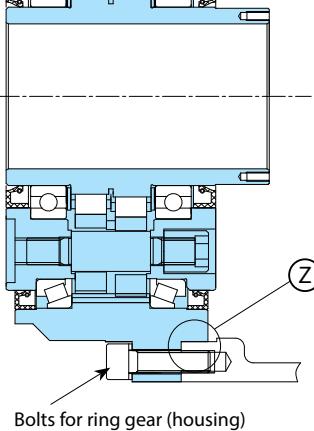

Table C20 (Dimensions in mm)

## 7.8.2 Assembly procedure

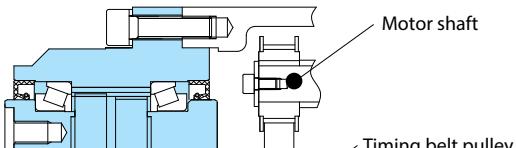

(1)

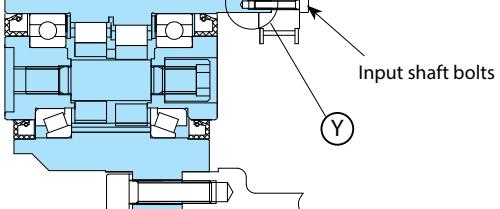

The Fine Cyclo C Series is attached to the machine casing by bolts. (spigot Z)  
The opposite side (spigot A) can also be used for attachment to a machine housing when installed into the machine.

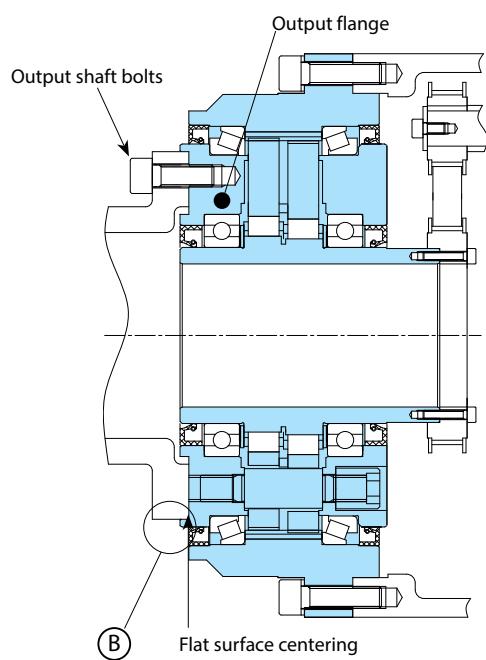

(2)

Use bolts to attach the timing belt pulley or equivalent parts to the input shaft.

(3)

Use bolts to attach output flange of Fine Cyclo to output shaft of machine.  
(spigot B)

### Note!

1. Make sure that you use the correct tightening torque for all fastening bolts when attaching the gearbox (see. Table C21).
2. Use bolts that are shorter than the depth of the threaded holes in the dimensioned drawings of the output flange.

### 7.8.3 Tightening torque and maximum permissible transmittable torque for bolts

The permissible transmitted torque for bolts and the number, size, and tightening torque for fastening the output side flange and the ring gear housing are listed in Table C21. In the event of an Emergency Stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

The safety instructions for installation in the operating manual must also be observed.

Size	Output flange bolts			Bolts for ring gear (housing)		
	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]
C15	16 × M6	13.6	1252	12 × M6	13.6	1520

C65	12 × M5	9.8	600

Table C21

- Bolting:** Use metric hexagon socket screws (DIN 4762, strength category 10.9).
- Countermeasure for bolts loosening:** Use adhesives (Loctite 243).

### 7.8.4 Lubrication

- The gearboxes of the Fine Cyclo C Series are filled with grease before delivery and are ready to use.
- Reconditioning is recommended after 20,000 operating hours, but at least every 3-5 years.
- The lifetime of the gearbox can be increased by returning it to the factory for overhauling and regreasing.

Specified grease	Manufacturer
Multemp FZ No. 00	Kyodo Yushi Co., Ltd.

## 8 UA Series

F4CF-UA  
F2CF-UA

### Special feature:

Upstream spur gear stage, gearbox with high positioning and path accuracy, even under changing dynamic conditions

- 7 sizes
- Low mass moments of inertia
- Double-stage ratios 66 to 283
- Nominal output torques up to 6952 Nm
- Acceleration torques up to 12500 Nm
- Input speeds up to  $10271 \text{ min}^{-1}$
- Lost motion < 0.75 arcmin
- Improved moment stiffness
- High efficiency, even at low speeds
- Low vibration
- Modular drive system

Table UA-2 Maximum acceleration and peak torque

1.  $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.

The nominal output torque for speeds less than  $5 \text{ min}^{-1}$  is equal to the value at  $5 \text{ min}^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 50% ED.

This value takes the efficiency of Fine Cyclo into consideration.

2.  $n_{2\max}$  = maximum permissible input speed

Gearbox can be used in the maximum input speed range specified in the table.

3.  $T_{2A}$  = Max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.

4.  $T_{2\max}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength).  
(permissible 1000 x over the entire lifetime)

5. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N, 15} \left( \frac{15}{n_{2m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at output speed  $n_{2m}$   
 $T_{2N, 15}$  : Rated torque at output speed  $n_{2m}$  is  $15 \text{ min}^{-1}$

<b>UA45</b>	3300	6600
<b>UA55</b>	5000	10000
<b>UA65</b>	8575	17150
<b>UA80</b>	12500	25000

Table UA-4 Maximum acceleration and peak torque

**1.  $T_{2N}$  = nominal output torque**

Nominal output torque corresponds to the max. permissible average load torque at all input speeds.

The nominal output torque for speeds  $n_2$  less than  $5 \text{ min}^{-1}$  is equal to the value at  $5 \text{ min}^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 50% ED.

This value takes the efficiency of Fine Cyclo into consideration.

**2.  $n_{2\max}$  = maximum permissible input speed**

Gearbox can be used in the maximum input speed range specified in the table.

**3.  $T_{2A}$  = Max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)**

Permissible peak torque for normal start and stop procedures.

**4.  $T_{2\max}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength). (permissible 1000 x over the entire lifetime)****5. The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:**

$$T_{2N} = T_{2N, 15} \left( \frac{15}{n_{2m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at output speed  $n_{2m}$   
 $T_{2N, 15}$  : Rated torque at output speed  $n_{2m}$  is  $15 \text{ min}^{-1}$

### 8.3 Stiffness and Lost Motion

Size	i	Test torque $T_p$ [Nm]	Lost Motion		Torsional stiffness 50% - 100% $T_p$ [Nm/arcmin]
			Lost Motion [arcmin]	Domain of definition [Nm]	
UA15	60 / 84 / 91 / 127 / 139 / 171	250	< 0.5	±7.5	63
UA25	78 / 88 / 115 / 124 / 145 / 173	500		±15	112
UA35	82 / 87 / 121 / 152 / 166	900		±27	196
UA45	82 / 99 / 121 / 130 / 152 / 166	1320		±40	343
UA55	81 / 97 / 126 / 145 / 169 / 241	2000		±60	530
UA65	89 / 121 / 136 / 144 / 163 / 171 / 199 / 249	3430		±103	933
UA80	93 / 103 / 122 / 155 / 166 / 190 / 239 / 283	5000		±150	1300

Table UA-5 Torsional stiffness

 $T_p$ : Test torque at input speed  $n_1 = 1500 \text{ min}^{-1}$ 

**Note** arcmin means "angular minute".  
Table values for stiffness are average values.

### Calculation of the twist angle:

1) At a load torque less than 3%  $T_p$ 

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

### 8.4 No-load running torque NLRT

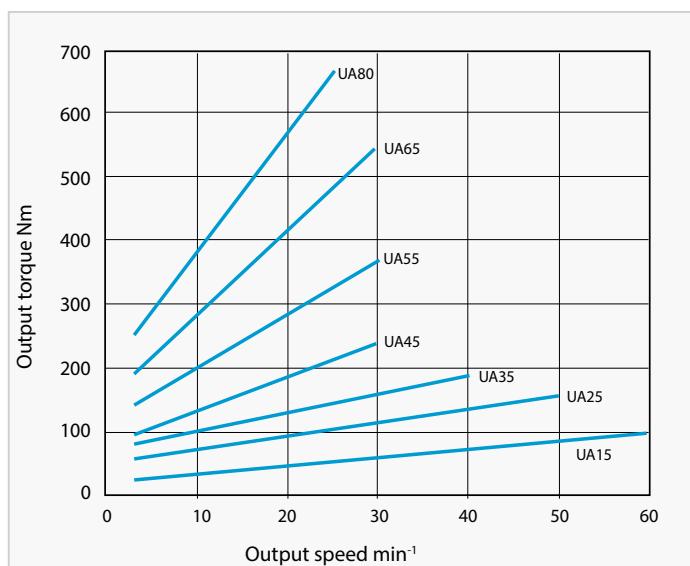

Fig. UA-1 Output side no-load running torque

**Note**

- Fig. UA-1 shows the average no-load running torque after gearbox is run in (not factory-new condition).
- Table UA-6 shows the measuring conditions

Ring gear housing temperature	approx. 30 °C
Precision during assembly	as per 8.8.1
Lubrication	Standard lubrication

Table UA-6 Measurement conditions

## 8.5 Breakaway torque

Indicates the necessary torque for breakaway of the gearbox on the input or output side, after stop without output side load.

### Breakaway torque on output side (BTO)

- Note**
- Table UA-8 shows the max. breakaway torque on the output side BTO. Fine Cyclo gearboxes are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  - Table UA-7 shows the measuring conditions

Size	Breakaway torque BTO [Nm]
<b>UA15</b>	< 20
<b>UA25</b>	< 49
<b>UA35</b>	< 88
<b>UA45</b>	< 108
<b>UA55</b>	< 137
<b>UA65</b>	< 167
<b>UA80</b>	< 196

Table UA-8 Value of the breakaway torque on the output side (BTO)

### Breakaway torque on input side (BTI)

- Note**
- Table UA-9 shows the max. breakaway torque BTI on the input side. BTI is defined as the maximum value (factory-new condition) which steadily decreases during the lifetime.
  - The following equation is to be used to calculate the input torques of the idle time losses:
  - Table UA-7 shows the measuring conditions

$$\text{Input torque} = \frac{\text{Output torque}}{\text{Ratio}}$$

Precision during assembly	as per 8.8.1
Lubrication	Standard lubrication

Table UA-7 Measurement conditions

Table UA-9 Value of the breakaway torque on the input side (BTI)

## 8.6 Efficiency

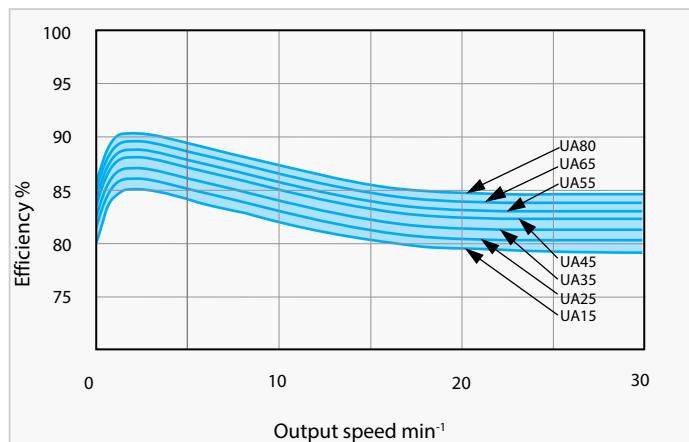

Fig. UA-2 Efficiency curve

Fig. UA-2 show the efficiency of a run-in gearbox under nominal load at an ambient temperature of 20 °C.

For more information, see "9 Description of technical specifications for cycloidal gearboxes" on page 20.

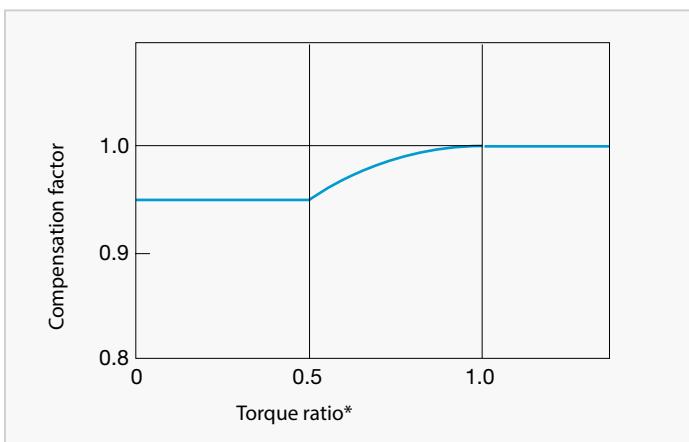

Fig. UA-3 Compensation curve for efficiency

$$\text{* Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

- Note**
1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. UA-3.
  2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. UA-3).

## 8.7 Bearing loads

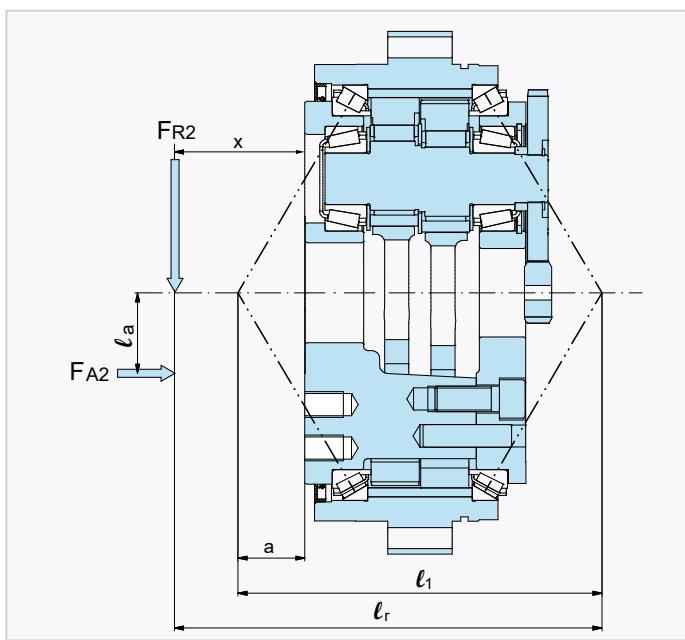

Fig. UA-4 Distance between the individual loading points

$$\ell_r = x - a + \ell_1 \quad (\text{Equation UA-4})$$

### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{Equation UA-5})$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot \ell_r + F_{A2} \cdot \ell_a) \quad (\text{equation UA-6})$$

### 2. Max. permissible bending moment and max. permissible axial load

Check the external bending moment and the external axial load using equations UA-6, UA-7, UA-8 and Table UA-14.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot \ell_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot \ell_a) < T_{kmax} \quad (\text{equation UA-7})$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad (\text{Equation UA-8})$$

Size	Values of internal bearing distance	
	$\ell_1$ [mm]	a [mm]
UA15	114.2	20.4

## 8.8 Assembly specifications and tolerances

### 8.8.1 Assembly tolerances

To ensure the function, lifetime, and characteristics of the gearbox, the radial run-out of the shaft ends, the coaxiality and the axial run-out of the fastening surface as per EN 50347:2001 are sufficient. When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Size	$\varnothing X$	$\varnothing Y$	$\varnothing Z$	$\varnothing D_p$ max.	yP max.	$z_{so}$ $\pm 0.2$	w
UA15	28	90	113	104.5	28.4	19.0	6
UA25	32	110	137	124.3	29.5	18.5	8

UA65	55	210	255	231.3	41.0	26.5	10
UA80	62	238	284	262.7	60.7	46.0	10

Table UA-15 (Dimensions in mm)

### 8.8.2 Tightening torque and maximum permissible transmittable torque for bolts

The permissible transmitted torque for bolts and the number, size, and tightening torque for fastening the output side flange and the ring gear housing are listed in Table UA-16. In the event of an Emergency Stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced. Liquid sealing material must be applied between all fittings of the gearbox with the customer's applications.

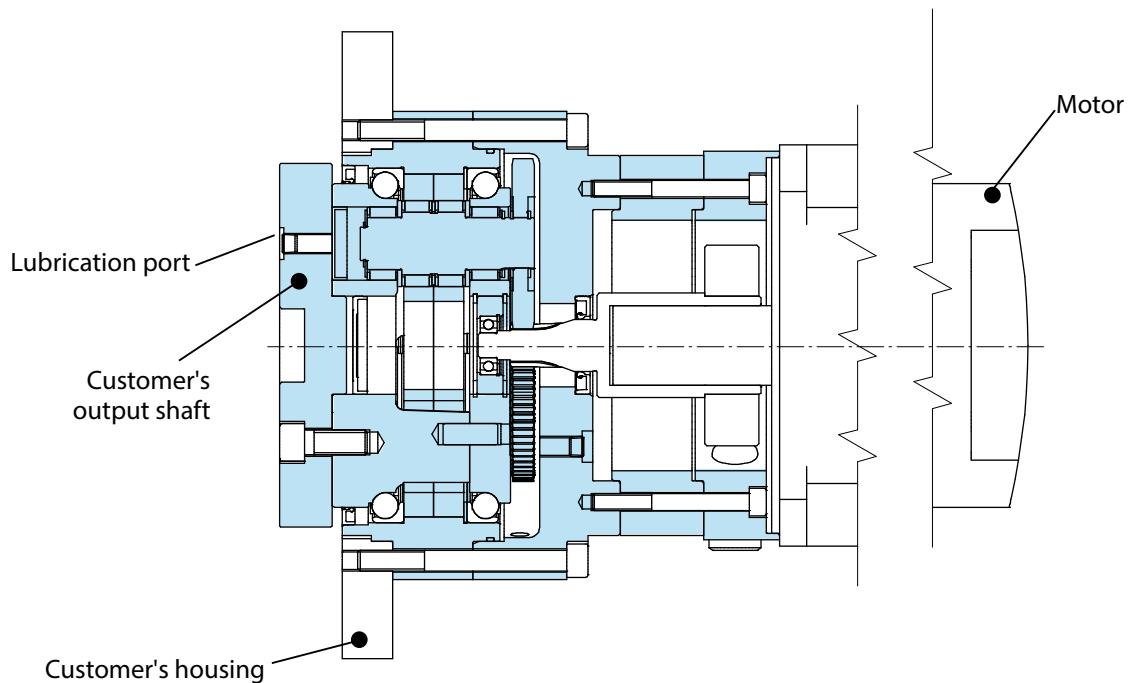

The safety instructions for installation in the operating manual must also be observed.

Size	Output flange bolts				Bolts for ring gear (housing)		
	Number and size of bolts	Pitch circle- $\varnothing$	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmittable torque for bolts [Nm]

UA65	21 × M12 12 × M12	177 136	133	22321	18 × M12	133	20656
UA80	15 × M16 9 × M16	193 139	331	32221	24 × M12	133	30545

Table UA-16 Bolt tightening torque and permissible torque values

- Bolting:** Use metric hexagon socket screws (DIN 4762, strength category 12.9).
- Countermeasure for bolts loosening:** Use adhesives (Loctite 243).

#### 8.8.4 Installation example

The customer's output shaft is bolted to the output flange of the gearbox.

Motor mounting different from catalogue standard:  
The correct penetration depth of the gearing (shaft distance from output) must be observed as per the Fine Cyclo catalogue (see the dimension sheets).

#### 8.8.3 Lubrication

- Differing from the standard, type F2/4CF-UA Fine Cyclo gearboxes are delivered without grease and must therefore be filled with Multemp FZ No.00 grease as specified in Table UA-178 and sealed before commissioning (for grease filling port, see illustration).  
These greases are suitable for ambient temperatures from -10 °C to +40 °C.
- Reconditioning is recommended after 20,000 operating hours, but at least every 3-5 years.
- UA-Modular as per the standard catalogue version are designed for lubrication in any mounting position.

Specified grease	Manufacturer
Multemp FZ No. 00	Kyodo Yushi Co., Ltd.
Conditions for use:	
Ambient temperature -10 °C to +40 °C	

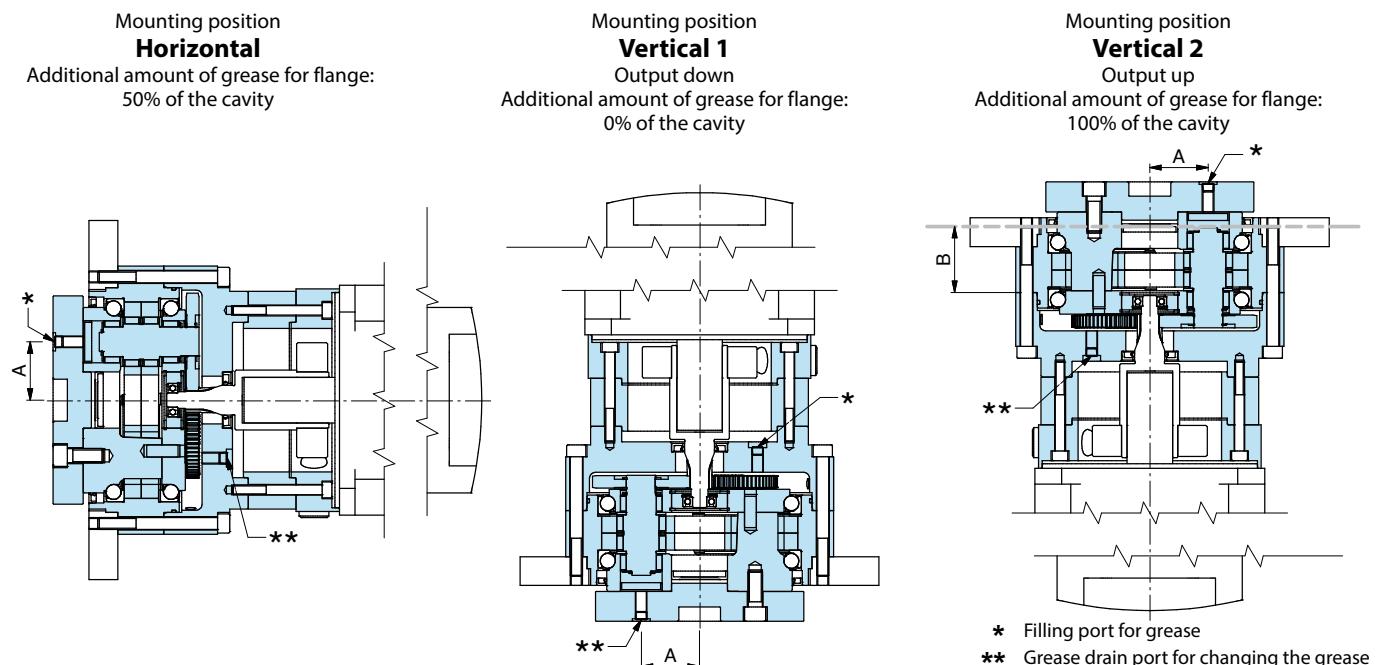

Table UA-17 Specified grease for the UA Series

Size	Prescribed grease filling quantity			Filling and outlet position hole	Grease filling level
	Quantity of grease [g]			A [mm]	B [mm]
	Horizontal	Vertical 1	Vertical 2		
UA15	122	152	143	29	33

## 9 E series

### Special feature:

Complete set with integrated cross roller bearing and hollow shaft for optimal implementation of cables and media up to Ø25.5 mm

- High stiffness
- Lost motion 1.0 arcmin
- Transmission error 0.75 arcmin
- Maximum input speed 8,500 rpm
- Permissible torques up to 219 Nm
- Completely sealed, including main cross roller bearing

## 9.1 Torques according to output speeds

Table ECY-1 Rating values (reference value output speed  $n_{2m}$ )

- $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.

The nominal output torque for speeds less than  $5 \text{ min}^{-1}$  is equal to the value at  $5 \text{ min}^{-1}$ .

The value for the maximum permissible input power is calculated from the nominal output torque at 100%.

This value takes the efficiency of Fine Cyclo into consideration.

- $n_{1max}$  = maximum permissible input speed

However, it must be  $n_{1m}$  (mean input speed)  $< n_{1ED}$ .

- $n_{1ED}$  = permissible input speed according to duty cycle

- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.

- $T_{2max}$  = max. permissible torque for Emergency Stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 times during the entire lifetime).

- The rated torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N, 600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at output speed  $n_{1m}$   
 $T_{2N, 600}$  : Rated torque at output speed  $n_{1m}$  is 600  $\text{min}^{-1}$

## 9.2 Torques according to input speeds

Model	Size	Input speed $n_{2m}$ [rpm]		600			1500			2000			2500			Max. permissible input speed $n_{1ED}$ [ $\text{min}^{-1}$ ]	Max. moment of inertia $J$ related to the input shaft of the basic gearbox [ $\times 10^{-4} \text{ kgm}^2$ ]	Mass [kg]

	$\theta_1$	arcmin	1.2	1.3	1.4
	$\theta_2$	arcmin	3.5	4.6	4.7
205	$\theta_3$	arcmin	8.5	9.0	8.9
	T3	Nm	43	74	137
	K1	Nm/arcmin	3.9	6.6	11.6
		$\times 10^4$ Nm/rad	1.3	2.3	4.0
	K2	Nm/arcmin	4.0	7.4	12.5
		$\times 10^4$ Nm/rad	1.4	2.5	4.3
	K3	Nm/arcmin	5.0	8.5	14.4
		$\times 10^4$ Nm/rad	1.7	2.9	5.0
	$\theta_1$	arcmin	1.0	1.1	1.2
107	$\theta_2$	arcmin	3.0	3.5	3.9
	$\theta_3$	arcmin	9.2	9.3	10.1
	T3	Nm	54	82	157
	K1	Nm/arcmin	3.8	7.7	10.7
		$\times 10^4$ Nm/rad	1.3	2.6	3.7
	K2	Nm/arcmin	4.3	8.2	11.0
		$\times 10^4$ Nm/rad	1.5	2.8	3.8
	K3	Nm/arcmin	5.4	9.5	15.9
		$\times 10^4$ Nm/rad	1.9	3.3	5.5
	$\theta_1$	arcmin	1.0	0.9	1.3
	$\theta_2$	arcmin	2.9	3.1	4.4
	$\theta_3$	arcmin	10.7	9.1	11.3

**Note** arcmin means "angular minute".  
Stiffness values in the tables are mean values.

## 9.4 No-load running torque NLRT

No-load running torque NLRT: refers to the torque on the input side required to rotate the gear without a load.

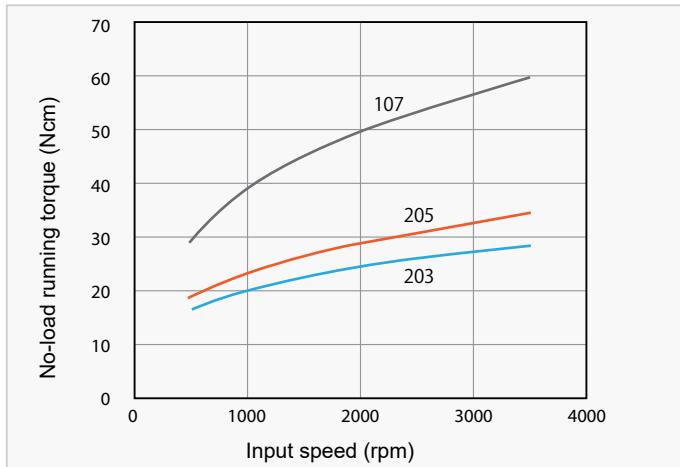

Fig. ECY-1 No-load running torque NLRT

- Notes:
1. Typical values after run-in.
  2. Lubrication: using our standard grease
  3. Surface temperature of the E CYCLO: approx. 40 °C

## 9.5 Breakaway torque

Breakaway torque: Indicates the torque required to start rotation at the output side of the gearbox without a load.

Table 9-2 Breakaway torque on output shaft (Nm)

Reduction ratio	Size		
	203	205	107
50	20	21	22
80	31	34	40
100	33	45	51

- Notes:
1. Typical values after run-in.
  2. Lubrication: using our standard grease

## 9.6 Efficiency

**Efficiency:** This is the ratio between the actual and the theoretical input torque when the rated torque is applied to the output side. Efficiency varies according to the input speed, load torque, grease temperature, reduction ratio, etc.

The figure shows the efficiency values in relation to the input speed at the rated torque and an E CYCLO surface temperature of approximately 40 °C.

When using the E CYCLO under a load torque other than the rated torque, correct the efficiency using the correction curve shown in Fig. ECY-5.

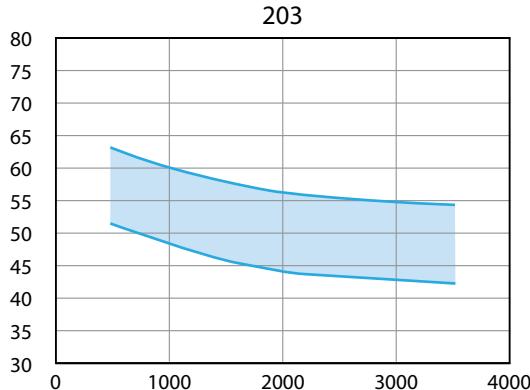

Fig. ECY-2 Efficiency of E Cyclo 203

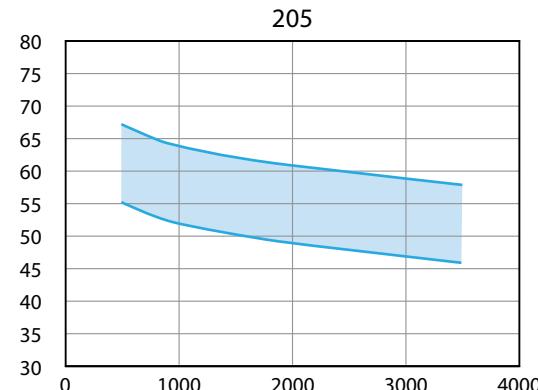

Fig. ECY-4 Efficiency of E Cyclo 205

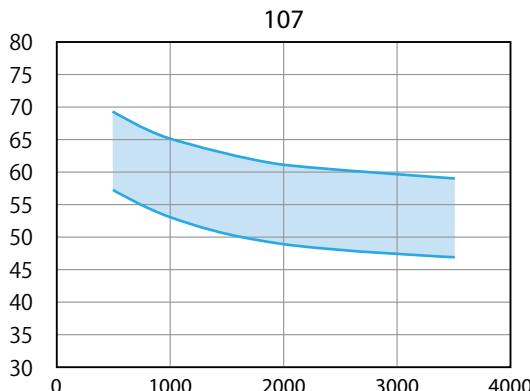

Fig. ECY-3 Efficiency of E Cyclo 107

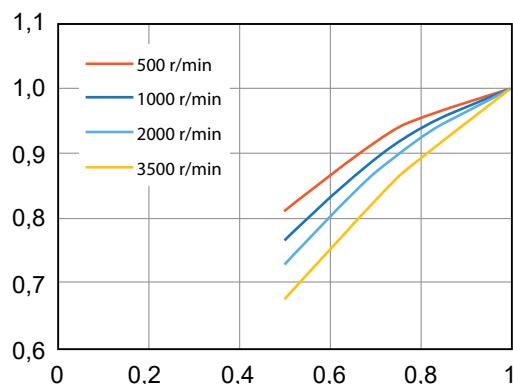

Fig. ECY-5 Efficiency correction curve

Corrected efficiency value = efficiency value x correction factor

- Notes:**
1. The efficiency values are typical values after the run-in time and are displayed within a specific range.
  2. Lubrication: using our standard grease
  3. Surface temperature of the E CYCLO: approx. 40 °C

- Notes:**
1. If the load torque is less than the rated torque, the efficiency decreases.
  2. If the torque ratio is 1.0 or higher, the efficiency correction factor is 1.0.

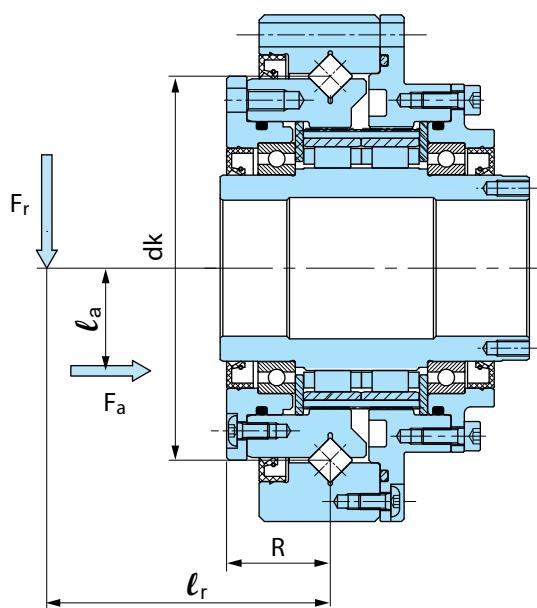

Fig. ECY-6 Load position output

	Load factor	
	Radial load X_L	Axial load Y_L
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} \leq 1.5$	1	0.45
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} > 1.5$	0.67	0.67

$F_{A2}$  = output side axial load [N]

$F_{R2}$  = output side radial load [N]

$C_{f2}$  = correction factor output

$B_{f2}$  = service factor output

$d_k$  = Mean bearing diameter [mm]

$T_{k\max}$  = maximum permissible bending moment [Nm]

$T_k$  = bending moment [Nm]

$\varphi_1$  = tilt angle [arcmin]

$\Theta_1$  = moment stiffness main bearing [Nm/arcmin]

$T_{2v}$  = reference torque [Nm]

$d_0$  = pitch circle diameter of output element [mm]

$C$  = dynamic load rating

$C_0$  = static load rating

$P$  = equivalent load

For power transmission by means of pinion, timing belt, or similar:

$$F_{R2} = C_{f2} \cdot B_{f2} \cdot \frac{2 \cdot 10^3 \cdot T_{2v}}{d_0} \quad (\text{Equation E-9})$$

Size	$\Theta_1^*$ [Nm/arcmin]	$T_{k\max}$ [Nm]	$d_k$ [mm]	$R$ [mm]	$C$ [N]	$C_0$ [N]
203	29.4	105	54.7	18.75	9000	18300
205	42.2	159	63	19.40	12900	19700
107	59.1	219	72	19.85	18100	30400

Table ECY-6 Specification cross roller bearings

### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the output flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad (\text{equation E-5})$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad (\text{equation E-6})$$

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{k\max} \quad (\text{Equation E-7})$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2\max} \quad (\text{equation E-8})$$

Correction factor	$C_{f2}$
Chain	1
Gear or pinion	1.25
Timing belt	1.25
V-Belt	1.5

Table A1 Correction factor output  $C_{f2}$ 

Service factor	$B_{f2}$
Uniform load	1
Light impacts	1.2
Severe impacts	1.6

Table A2 Service factor output  $B_{f2}$ 

A dynamically equivalent load  $P$  on the bearing is calculated from these loads.

With the equivalent load  $P$  and the mean input speed  $n_{2m}$ , it is possible to test whether the output bearing achieves the desired lifetime  $L_{h10}$ .

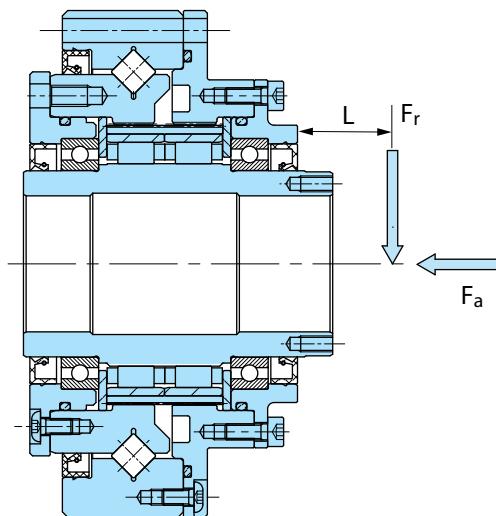

$$P = X_L \left( F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k} \right) + Y_L \cdot F_{A2} \quad (\text{Equation E-10})$$

$$L_{h10} = \frac{10^6}{60 \cdot n_{2m}} \left( \frac{C}{P} \right)^{\frac{10}{3}} \quad (\text{Equation E-11})$$

\* Values for stiffness are reference values.

## 9.7 Bearing loads

### 9.7.1 Maximum permissible radial and axial load on the input shaft

L [mm]	Load factor input $L_{f1}$		
	103	105	107
5	1.01	0.99	0.97
10	1.13	1.10	1.07
15	1.25	1.21	1.18
20	1.37	1.32	1.28
25	1.49	1.43	1.39
30	1.61	1.54	1.49
35	1.73	1.65	1.60
40	-	-	1.70
L (mm), if $L_f = 1 \text{ (mm)}$	4.6	5.5	6.6

Table ECY-7 Load factor input  $L_{f1}$   
L = distance from input side carrier

**Note** Use linear addition to calculate the load factor  $L_f$  at load position L, which is not shown in the table.

When mounting a gear, pulley or roller on an input shaft: Operate the gearbox in such a way that the radial and axial loads do not exceed the permissible values. Check the radial load and axial load of the input shaft using the following equations (ECY-1 to 3).

#### 1. Input side radial load $F_R$

$$F_R = \frac{T_I}{r_0} \leq \frac{F_{R\max}}{L_f \cdot C_f \cdot B_f} \quad [\text{N}] \quad (\text{Equation ECY-1})$$

#### 2. Input side axial load $F_A$

$$F_A \leq \frac{F_{A\max}}{C_f \cdot B_f} \quad [\text{N}] \quad (\text{Equation ECY-2})$$

#### 3. When radial and axial loads co-exist

$$\left( \frac{F_R \cdot L_f}{F_{R\max}} + \frac{F_{A1}}{F_{A\max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation ECY-3})$$

$F_R$  = Input side radial load [N]

$T_I$  = Actual transmission torque at output shaft [Nm]

$r_0$  = pitch circle radius of sprocket, pinion, or timing belt pulley [m]

$F_{R\max}$  = maximum permissible input side radial load [ N ] (Table ECY-10)

$F_A$  = input side axial load [N]

$F_{A\max}$  = max. permissible input side axial load [ N ] (Table ECY-7)

$L_{f1}$  = load factor input (Table ECY-7)

$C_{f1}$  = correction factor input (Table ECY-8)

$B_{f1}$  = service factor input (Table ECY-9)

$L$  = distance of radial load from front end on input side of the input shaft [mm] (Table ECY-7)

Correction factor input	$C_{f1}$
Chain	1
Gear or pinion	1.25
Timing belt	1.25
V-Belt	1.5

Table ECY-8 Correction factor input  $C_{f1}$

Service factor input	$B_{f1}$
Uniform load	1
Light impacts	1 – 1.2
Severe impacts	1.4 – 1.6

Table ECY-9 Service factor input  $B_{f1}$

Size	Input speed $n_{1m}$ [min <sup>-1</sup> ]								
	4000	3000	2500	2000	1750	1500	1000	750	600
203	198	218	232	250	261	275	315	347	373
205	218	240	255	275	288	303	346	381	411
107	238	262	278	300	314	330	378	416	448

Table ECY-10 Max. permissible input side radial load  $F_{R\max}$  [N]

Size	Input speed $n_{1m}$ [min <sup>-1</sup> ]								
	4000	3000	2500	2000	1750	1500	1000	750	600
203	169	191	207	228	242	259	308	349	385
205	186	210	228	250	266	284	339	384	424
107	212	240	260	283	303	324	387	439	483

Table ECY-11 Max. permissible input side axial load  $F_{A\max}$  [N]

**Note** The permissible radial and axial loads at an input speed of less than 600 rpm are the same as the values for 600 rpm.

### Calculation of the max. permissible radial load on the input shaft

Calculation of the max. permissible radial load using the following equation when the speed is not shown in the table above.

$$F_{R\max} = F_{R,2000} \left( \frac{2000}{n_{1m}} \right)^{1/3}$$

$F_{R\max}$  = maximum permissible input side radial load at input speed  $n_{1m}$   
 $F_{R,2000}$  = Input side radial load at input speed  $n_{1m} = 600$  rpm

### Calculation of the max. permissible axial load on the input shaft

Calculation of the max. permissible axial load using the following equation when the speed is not shown in the table above.

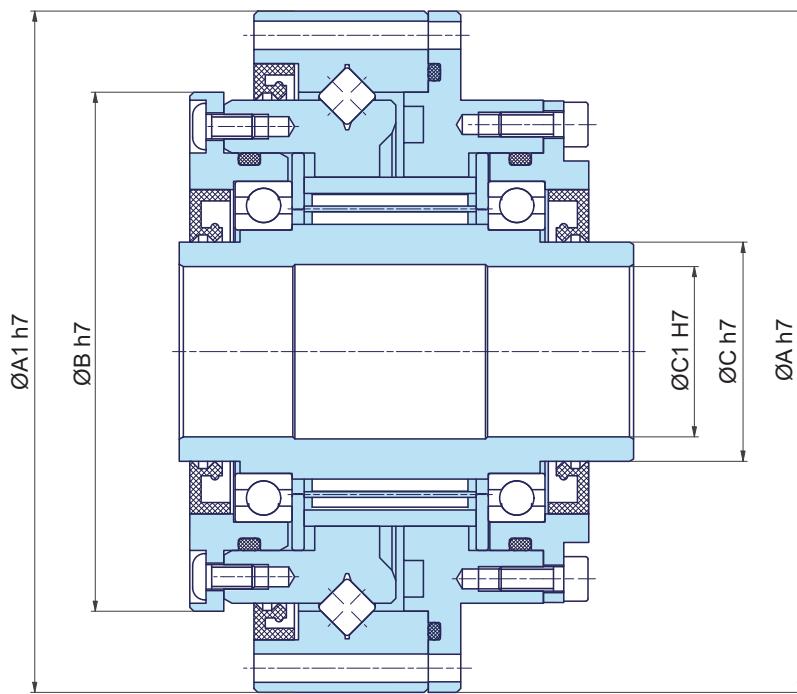

$$F_{A\max} = F_{A,2000} \left( \frac{2000}{n_{1m}} \right)^{0.44}$$

$F_{A\max}$  = maximum permissible input side axial load at input speed  $n_{1m}$   
 $F_{A,2000}$  = Axial load on input side at input speed  $n_{1m} = 2000$  rpm

## 9.8 Assembly specifications and tolerances

### 9.8.1 Assembly tolerances

Fits for assembly of input and output parts (timing belt, disc, gear, etc.) are shown schematically in the following figure. Use the diameters and tolerances shown in the table below.

\* valid for size C15

Size	$\varnothing W$	$\varnothing X$	$\varnothing Y$	$\varnothing W$	$\varnothing Z$
<b>203</b>	74	74	54	24.9	19
<b>205</b>	84	84	64	27	21
<b>107</b>	95	95	72	34.5	25.5

Table ECY-12 (Dimensions in mm)

### 9.8.2 Installation method

Use spigot C when assembling the input drive parts (pulleys and gears).

Use spigot B to assemble the gearbox output side and spigot A to assemble the housing.

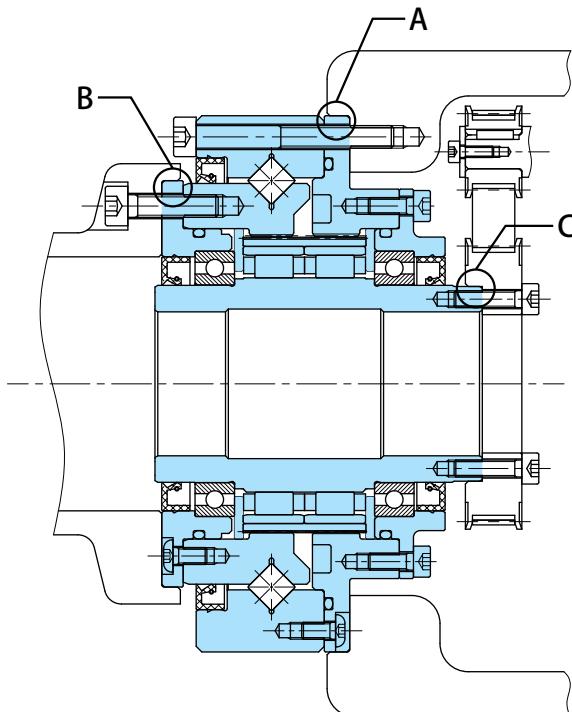

Fig. ECY-7 Installation of E CYCLO

### 9.8.3 Bolt tightening torque and maximum permissible transmittable torque for bolts

Tables ECY Table ECY-13 to Table ECY-14 show the number, size and tightening torque of bolts for securing the input and output side of the E CYCLO.

The safety instructions for installation in the operating manual must also be observed.

Size	Output side flange bolts				Housing bolts			Permissible transmittable torque of bolts	
	Number of bolts	Size DIN 4762-12.9	Tightening torque per bolt	Number of bolts	Size DIN 4762-12.9	Tightening torque per bolt			
			Nm						
203	16	M3	1.96	16	M3	1.96		163	
205	16	M3	1.96	16	M3	1.96		189	
107	16	M4	4.61	16	M4	4.61		374	

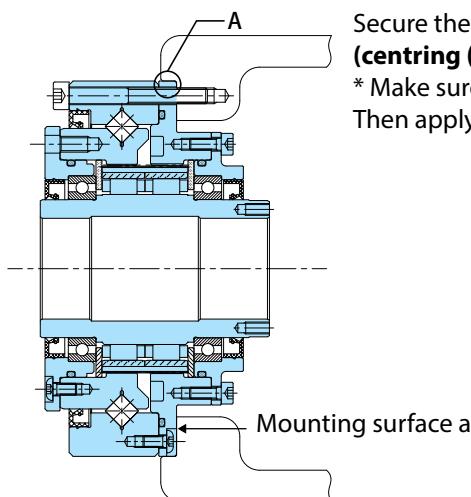

Table ECY-13

Size	Input shaft				• <b>Bolting:</b> Use metric hexagon socket screws (DIN 4762, strength category 12.9). • <b>Countermeasure for bolts loosening:</b> Use adhesives (Loctite 243).	
	Number of bolts	Size DIN 4762-12.9	Tightening torque per bolt	Permissible transmittable torque of bolts		
203	6	M2	0.55	5		
205	8	M2	0.55	8		
107	6	M3	1.96	35		

Table ECY-14

### 9.8.4 Installation example

[1]

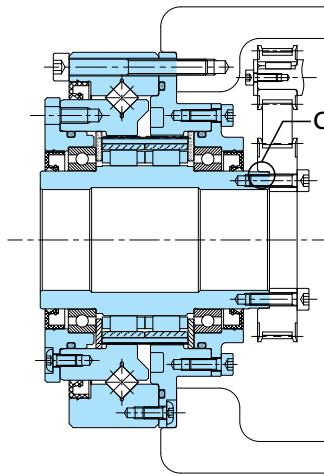

Secure the gearbox to the machine housing using bolts.

**(centring (A))**

\* Make sure that the centring (A) is not wider than the fixed flange.  
Then apply liquid sealant to the mounting surface, if necessary.

Figure 13-2

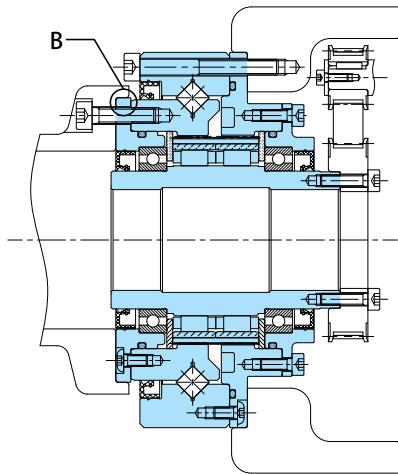

[2]

Screw the pulley and the remaining input parts to the input shaft.  
**(centring (C))**

Figure 13-3

[3]

Bolt the outside cover (including the internal gear) to the output shaft on the device.

**(centring (B))**

Figure 13-4

Notes:

1. When installing the gearbox, tighten the bolts to the specified tightening torque (see Table ECY-13).
2. When bolting the output shaft to the external cover (including the ring gear), set the bolt length shorter than the thread depth shown on enlarged part A of the outline drawing (see from Page 138).

### 9.8.5 Lubrication

E CYCLO is delivered already lubricated and sealed with HGO-3 No. 00 from Nippeco.

Replace the grease every 20,000 operating hours or every three to five years.

Size	203		205 (i = 50, 80)		205 (i = 100)		107	
	g	ml	g	ml	g	ml	g	ml
Grease quantity	7	8	14	16	10	12	16	18

The relative density is assumed to be 0.87 g/ml.

Table ECY-15

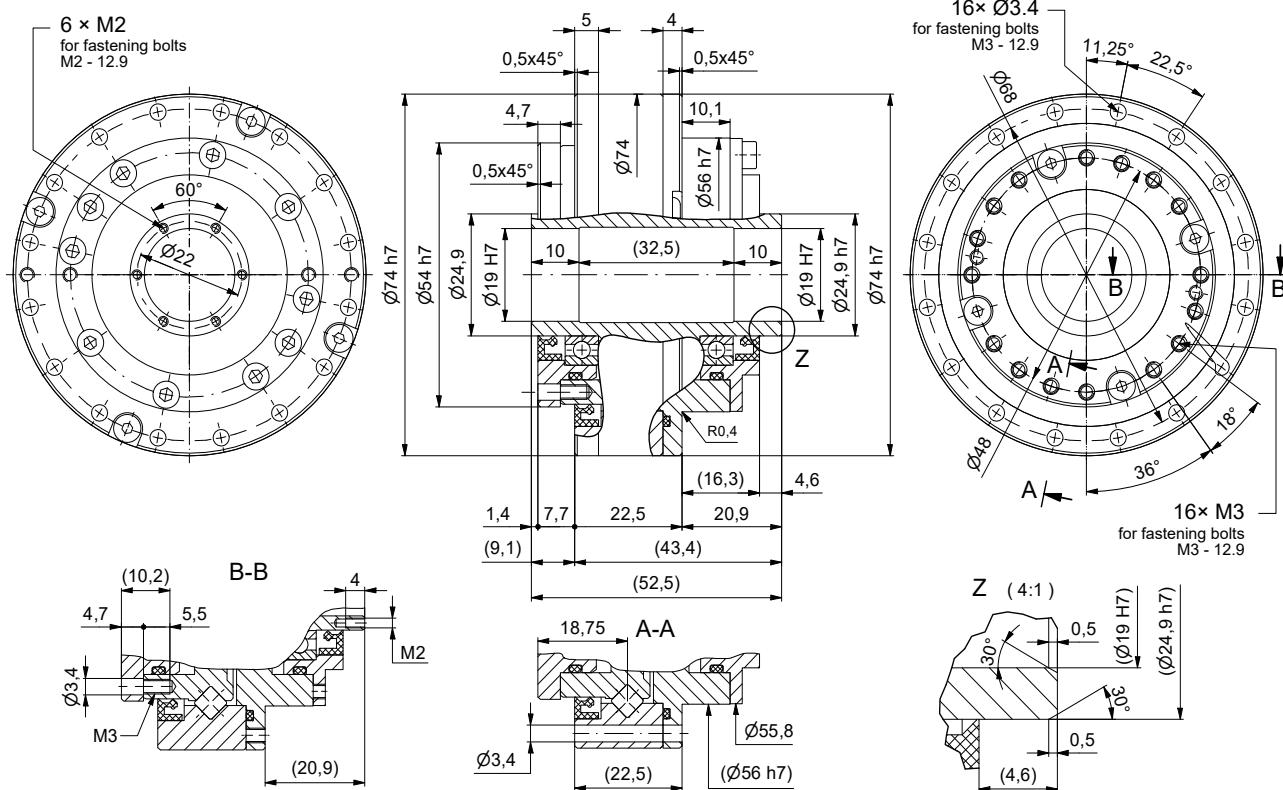

Brand name	HGO-3
Base oil	Refined mineral oil
Thickener	Lithium soap
Additive	Extreme pressure additives, etc.
Consistency no.	No. 00
Consistency (at 25 °C)	400-430
Appearance	Light brown

Table ECY-16

## Precision gearbox - application data sheet

Specific application data is required for the selection of a suitable precision gearbox.  
Please complete the following data sheet to enable us to respond quickly. Thank you.

### 1. Load cycle:

<p>Maximum input speed</p> <p>Time (s)</p> <p><math>t_A</math></p> <p><math>t_R</math></p> <p><math>t_B</math></p> <p><math>t_P</math></p> <p><math>t_M</math></p> <p><math>t_C</math></p>	$t_A$ = starting time $t_R$ = duration of uniform movement $t_B$ = braking time (delay time) $t_P$ = pause time (time between movements) $t_M$ = duration of the movement phase of a working cycle ( $t_A + t_R + t_B$ ) $t_C$ = duration of the entire working cycle ( $t_M + t_P$ )
<p><math>T_A</math></p> <p><math>T_R</math></p> <p><math>T_B</math></p> <p><math>T_P</math></p> <p><math>T_B</math></p> <p>Time (s)</p>	$T_A$ = torque when starting (acceleration torque) $T_R$ = torque at constant speed $T_B$ = brake torque (delay torque) $T_P$ = pause torque (to hold the position between the movements if necessary)
<input type="text"/> kgm <sup>2</sup> <input type="text"/> °	Moment of inertia of the application Total travel angle

Precision gearbox - application data sheet

**2. What is the required reduction ratio? \_\_\_\_\_: 1**

**3. Please specify the following input power data (motor):**

1. Nominal speed: \_\_\_\_\_ [min<sup>-1</sup>]

2. Continuous static torque: \_\_\_\_\_ [Nm]

3. Peak torque: \_\_\_\_\_ [Nm]

4. Manufacturer: \_\_\_\_\_

5. Model number: \_\_\_\_\_

**4. Is a hollow shaft required?**

Table A1 yes      If applicable, how large? \_\_\_\_\_  
 Table A2 no

**5. Should Sumitomo provide an input adapter?**

Table A3 yes  
 Table A4 no

If you have selected "Yes", please specify the dimensions of the input or submit a copy of the dimensioned drawing.

Is it a motor shaft with or without a key?

Table A5 With key  
 Table A6 Without key

**6. How is the gearbox connected to the motor?**

Table A7 Direct coupling  
 Table A8 Timing belt or chain drive (continue with No. 6a)  
 Table A9 V-belt (continue with No. 6a)  
 Table A10 Spur gear (continue with No. 6a)  
 Table A11 Other (continue with No. 6a)

**6a. Definition of prestage**

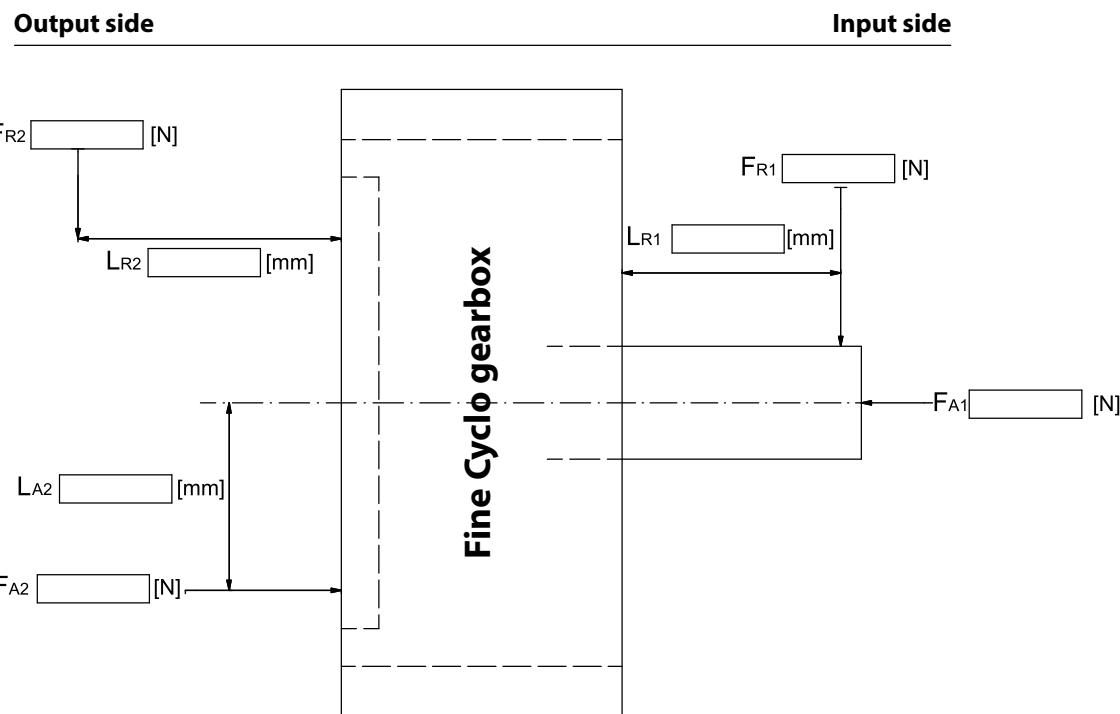

Inertia Ratio	kg·m <sup>2</sup>

**7. How is the gearbox connected to the final load?**

Table A12 Direct coupling  
 Table A13 Timing belt or chain drive  
 Table A14 Spur gear  
 Table A15 Other

**8. Please select one of the following load properties:**

Table A16 Uniform load  
 Table A17 Moderate impact load  
 Table A18 Heavy impact load

**9. Radial and axial load**

$F_R$  = Radial load

$L_R$  = Distance from radial force to flange collar

$F_A$  = Axial load

$L_A$  = Distance of the axial load from the centre line

1: Input side

2: Output side

**10. Please describe your application in as much detail as possible (if possible, please enclose drawing).**
